Appendix TR-1

Transportation Impact Report

Transportation Impact Report
Jackson Township Specific Plan

prepared for:
Sacramento County
Community Development PERD

Prepared by
DKS Associates

February 2019

DKS

Table of Contents

1. Introduction 1
   1.1 Study Definition 1
   1.2 Study Area 5
   1.3 Analysis Methodology 5
      1.3.1 Forecasting 5
      1.3.2 Operations Analysis 5
   1.4 Level of Service Policies 13
      1.4.1 County of Sacramento 13
      1.4.2 City of Sacramento 15
      1.4.3 City of Rancho Cordova 17
      1.4.4 City of Elk Grove 17
      1.4.5 City of Folsom 17
      1.4.6 Caltrans 18
      1.4.7 Capital SouthEast Connector Joint Powers Authority (Connector JPA) 18
   1.5 Significance Criteria 18
      1.5.1 Roadways Segments and Intersections 18
      1.5.2 Freeway Facilities 18
      1.5.3 Bicycle and Pedestrian Facilities 21
      1.5.4 Transit 21
      1.5.5 Rural Roadway Functionality 21
   1.6 Development of Mitigation Measures 22
   1.7 High Capacity Intersections 23
2. Existing Conditions 24
   2.1 Roadway System 24
      2.1.1 Regional Access 24
      2.1.2 Local Access 24
   2.2 Transit System 26
   2.3 Bicycle System 26
   2.4 Pedestrian System 26
   2.5 Traffic Volumes 26
   2.6 Existing Operating Conditions 29
      2.6.1 Roadway Segments 29

2.6.2 Intersections 29
2.6.3 U.S. 50 Freeway 48
2.6.4 Rural Roadway Functionality 53
3. Existing Plus Jackson Township Project (Alternative 2) 57
3.1 Jackson Township Project (Alternative 2) Description 57
3.1.1 Land Use 57
3.1.2 Transportation Network 57
3.2 Trip Generation 63
3.3 Trip Distribution 63
3.4 Operations Analysis and Impacts 63
3.4.1 Existing Plus Jackson Township Project Roadway Segment Impacts 67
3.4.2 Existing Plus Jackson Township Project Intersection Impacts 67
3.4.3 Existing Plus Jackson Township Project U.S. 50 Freeway Impacts 91
3.4.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts 91
3.4.5 Existing Plus Jackson Township Project Transit System Impacts 97
3.4.6 Existing Plus Jackson Township Functionality Impacts 97
3.5 Mitigation 101
3.5.1 Existing Plus Jackson Township Project Roadway Segment Mitigation 101
3.5.2 Existing Plus Jackson Township Project Intersection Mitigation 101
3.5.3 Existing Plus Jackson Township Project U.S. 50 Freeway Mitigation 101
3.5.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation 107
3.5.5 Existing Plus Jackson Township Project Transit System Mitigation 107
3.5.6 Existing Plus Jackson Township Project Functionality Mitigation 107
3.5.7 Existing Plus Jackson Township Project Mitigation Summary 107
4. Existing Plus FOUR PROJECTS Scenario (Jackson Township Project Alternative 2) 113
4.1 Project Description 113
4.1.1 Land Use 113
4.1.2 Transportation Network 113
4.2 Trip Generation 118
4.3 Trip Distribution 120
4.4 Operations Analysis and Impacts 120
4.4.1 Existing Plus FOUR PROJECTS Roadway Segment Impacts 120
4.4.2 Existing Plus FOUR PROJECTS Intersection Impacts 133
4.4.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Impacts 133

4.4.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts 158
4.4.5 Existing Plus FOUR PROJECTS Transit System Impacts 158
4.4.6 Existing Plus FOUR PROJECTS Functionality Impacts 158
4.5 Mitigation 162
4.5.1 Existing Plus FOUR PROJECTS Roadway Segment Mitigation 162
4.5.2 Existing Plus FOUR PROJECTS Intersection Mitigation 162
4.5.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Mitigation 174
4.5.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation 175
4.5.5 Existing Plus FOUR PROJECTS Transit System Mitigation 175
4.5.6 Existing Plus FOUR PROJECTS Functionality Mitigation 175
4.5.7 Existing Plus FOUR PROJECTS Mitigation Summary 175
5. MTP Cumulative Plus FOUR PROJECTS Scenario 186
5.1 FOUR PROJECTS Description 186
5.1.1 MTP Cumulative Land Use 186
5.1.2 Transportation Network 188
5.2 Trip Generation 191
5.3 Operations Analysis 193
5.3.1 MTP Cumulative Plus FOUR PROJECTS Roadway Segments 193
5.3.2 MTP Cumulative Plus FOUR PROJECTS Functionality Exceeding the Threshold 204
5.4 MTP Cumulative Plus FOUR PROJECTS Mitigation Summary 207
6. CEQA Cumulative Plus FOUR PROJECTS Scenario (Jackson Township Alternative 2) 212
6.1 FOUR PROJECTS Description 212
6.1.1 CEQA Cumulative Land Use 212
6.1.2 Transportation Network 213
6.2 Trip Generation 218
6.3 Trip Distribution 218
6.4 Operations Analysis and Impacts 221
6.4.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Impacts 221
6.4.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Impacts 221
6.4.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Impacts 221
6.4.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts 255
6.4.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Impacts 263
6.4.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts 263

6.5 Mitigation 268
6.5.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Mitigation 268
6.5.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Mitigation..... 268
6.5.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Mitigation 271
6.5.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Mitigation 290
6.5.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Mitigation 290
6.5.7 CEQA Cumulative Plus FOUR PROJECTS Mitigation Summary..... 290
7. CEQA Cumulative Plus Jackson Township (Alternative 2) Scenario..... 304
7.1 Jackson Township Project Description and Methodology..... 304
7.1.1 Project Description..... 304
7.1.2 Methodology..... 304
7.1.1 CEQA Cumulative Land Use..... 304
7.1.2 Transportation Network..... 304
7.1.3 Jackson Township Project Trip Generation..... 304
7.1.4 Jackson Township Project Trip Distribution 305
7.2 Operations Analysis and Impacts..... 305
7.2.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Impacts 305
7.2.2 CEQA Cumulative Plus Jackson Township Project Intersection Impacts..... 306
7.2.3 CEQA Cumulative Plus Jackson Township Project U.S. 50 Freeway Impacts.... 312
7.2.4 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts 312
7.2.5 CEQA Cumulative Plus Jackson Township Project Transit System Impacts 312
7.2.6 CEQA Cumulative Plus Jackson Township Project Functionality Impacts 313
7.3 Mitigation..... 316
7.3.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Mitigation 316
7.3.2 CEQA Cumulative Plus Jackson Township Project Intersection Mitigation 319
7.3.3 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation..... 319
7.3.4 CEQA Cumulative Plus Jackson Township Project Transit System Mitigation .. 320
7.3.5 CEQA Cumulative Plus Jackson Township Project Functionality Mitigation..... 320
7.3.6 CEQA Cumulative Plus Jackson Township Project Mitigation Summary..... 327
8. Existing Plus Jackson Township (Proposed Project)..... 332
8.1 Jackson Township Proposed Project Description 332
8.1.1 Land Use 332

8.1.2 Transportation Network 332
8.2 Trip Generation 338
8.3 Trip Distribution 338
8.4 Operations Analysis and Impacts 338
8.4.1 Existing Plus Jackson Township Project Roadway Segment Impacts 342
8.4.2 Existing Plus Jackson Township Project Intersection Impacts 342
8.4.3 Existing Plus Jackson Township Project U.S. 50 Freeway Impacts 362
8.4.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts 362
8.4.5 Existing Plus Jackson Township Project Transit System Impacts 368
8.4.6 Existing Plus Jackson Township Functionality Impacts 368
8.5 Mitigation 372
8.5.1 Existing Plus Jackson Township Project Roadway Segment Mitigation 372
8.5.2 Existing Plus Jackson Township Project Intersection Mitigation 372
8.5.3 Existing Plus Jackson Township Project U.S. 50 Freeway Mitigation 372
8.5.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation 379
8.5.5 Existing Plus Jackson Township Project Transit System Mitigation 379
8.5.6 Existing Plus Jackson Township Project Functionality Mitigation 379
8.5.7 Existing Plus Jackson Township Project Mitigation Summary 379
9. Existing Plus FOUR PROJECTS Scenario (Jackson township Proposed Project) 386
9.1 Project Description 386
9.1.1 Land Use 386
9.1.2 Transportation Network 386
9.2 Trip Generation 391
9.3 Trip Distribution 393
9.4 Operations Analysis and Impacts 393
9.4.1 Existing Plus FOUR PROJECTS Roadway Segment Impacts 393
9.4.2 Existing Plus FOUR PROJECTS Intersection Impacts 406
9.4.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Impacts 406
9.4.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts 431
9.4.5 Existing Plus FOUR PROJECTS Transit System Impacts 431
9.4.6 Existing Plus FOUR PROJECTS Functionality Impacts 431
9.5 Mitigation 435
9.5.1 Existing Plus FOUR PROJECTS Roadway Segment Mitigation 435

9.5.2 Existing Plus FOUR PROJECTS Intersection Mitigation 435
9.5.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Mitigation 447
9.5.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation 448
9.5.5 Existing Plus FOUR PROJECTS Transit System Mitigation 448
9.5.6 Existing Plus FOUR PROJECTS Functionality Mitigation 448
9.5.7 Existing Plus FOUR PROJECTS Mitigation Summary 448
10. CEQA Cumulative Plus FOUR PROJECTS Scenario (Jackson Township Proposed Project) 460
10.1 FOUR PROJECTS Description 460
10.1.1 CEQA Cumulative Land Use 460
10.1.2 Transportation Network 461
10.2 Trip Generation 466
10.3 Trip Distribution 466
10.4 Operations Analysis and Impacts 469
10.4.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Impacts 469
10.4.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Impacts 469
10.4.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Impacts 469
10.4.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts 503
10.4.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Impacts 511
10.4.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts 511
10.5 Mitigation 515
10.5.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Mitigation 515
10.5.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Mitigation 515
10.5.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Mitigation 518
10.5.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Mitigation 535
10.5.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Mitigation 535
10.5.7 CEQA Cumulative Plus FOUR PROJECTS Mitigation Summary 535
11. CEQA Cumulative Plus Jackson Township (Proposed PROJECT) Scenario 548
11.1 Jackson Township Project Description and Methodology 548
11.1.1 Project Description 548
11.1.2 Methodology 548
11.1.1 CEQA Cumulative Land Use 548
11.1.2 Transportation Network 548
11.1.3 Jackson Township Project Trip Generation 548

11.1.4 Jackson Township Project Trip Distribution 549
11.2 Operations Analysis and Impacts 549
11.2.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Impacts 549
11.2.2 CEQA Cumulative Plus Jackson Township Project Intersection Impacts..... 550
11.2.3 CEQA Cumulative Plus Jackson Township Project U.S. 50 Freeway Impacts.... 556
11.2.4 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts 556
11.2.5 CEQA Cumulative Plus Jackson Township Project Transit System Impacts 556
11.2.6 CEQA Cumulative Plus Jackson Township Project Functionality Impacts 557
11.3 Mitigation 560
11.3.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Mitigation 560
11.3.2 CEQA Cumulative Plus Jackson Township Project Intersection Mitigation 563
11.3.3 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation..... 563
11.3.4 CEQA Cumulative Plus Jackson Township Project Transit System Mitigation .. 564
11.3.5 CEQA Cumulative Plus Jackson Township Project Functionality Mitigation..... 564
11.3.6 CEQA Cumulative Plus Jackson Township Project Mitigation Summary..... 571
12. Vehicle miles traveled per capita..... 575
12.1 VMT Description..... 575
12.2 Methodology..... 575
12.3 Existing Plus Project..... 575
12.3 MTP Plus All Projects 575

List of Figures

1. INTRODUCTION

1.1 STUDY DEFINITION

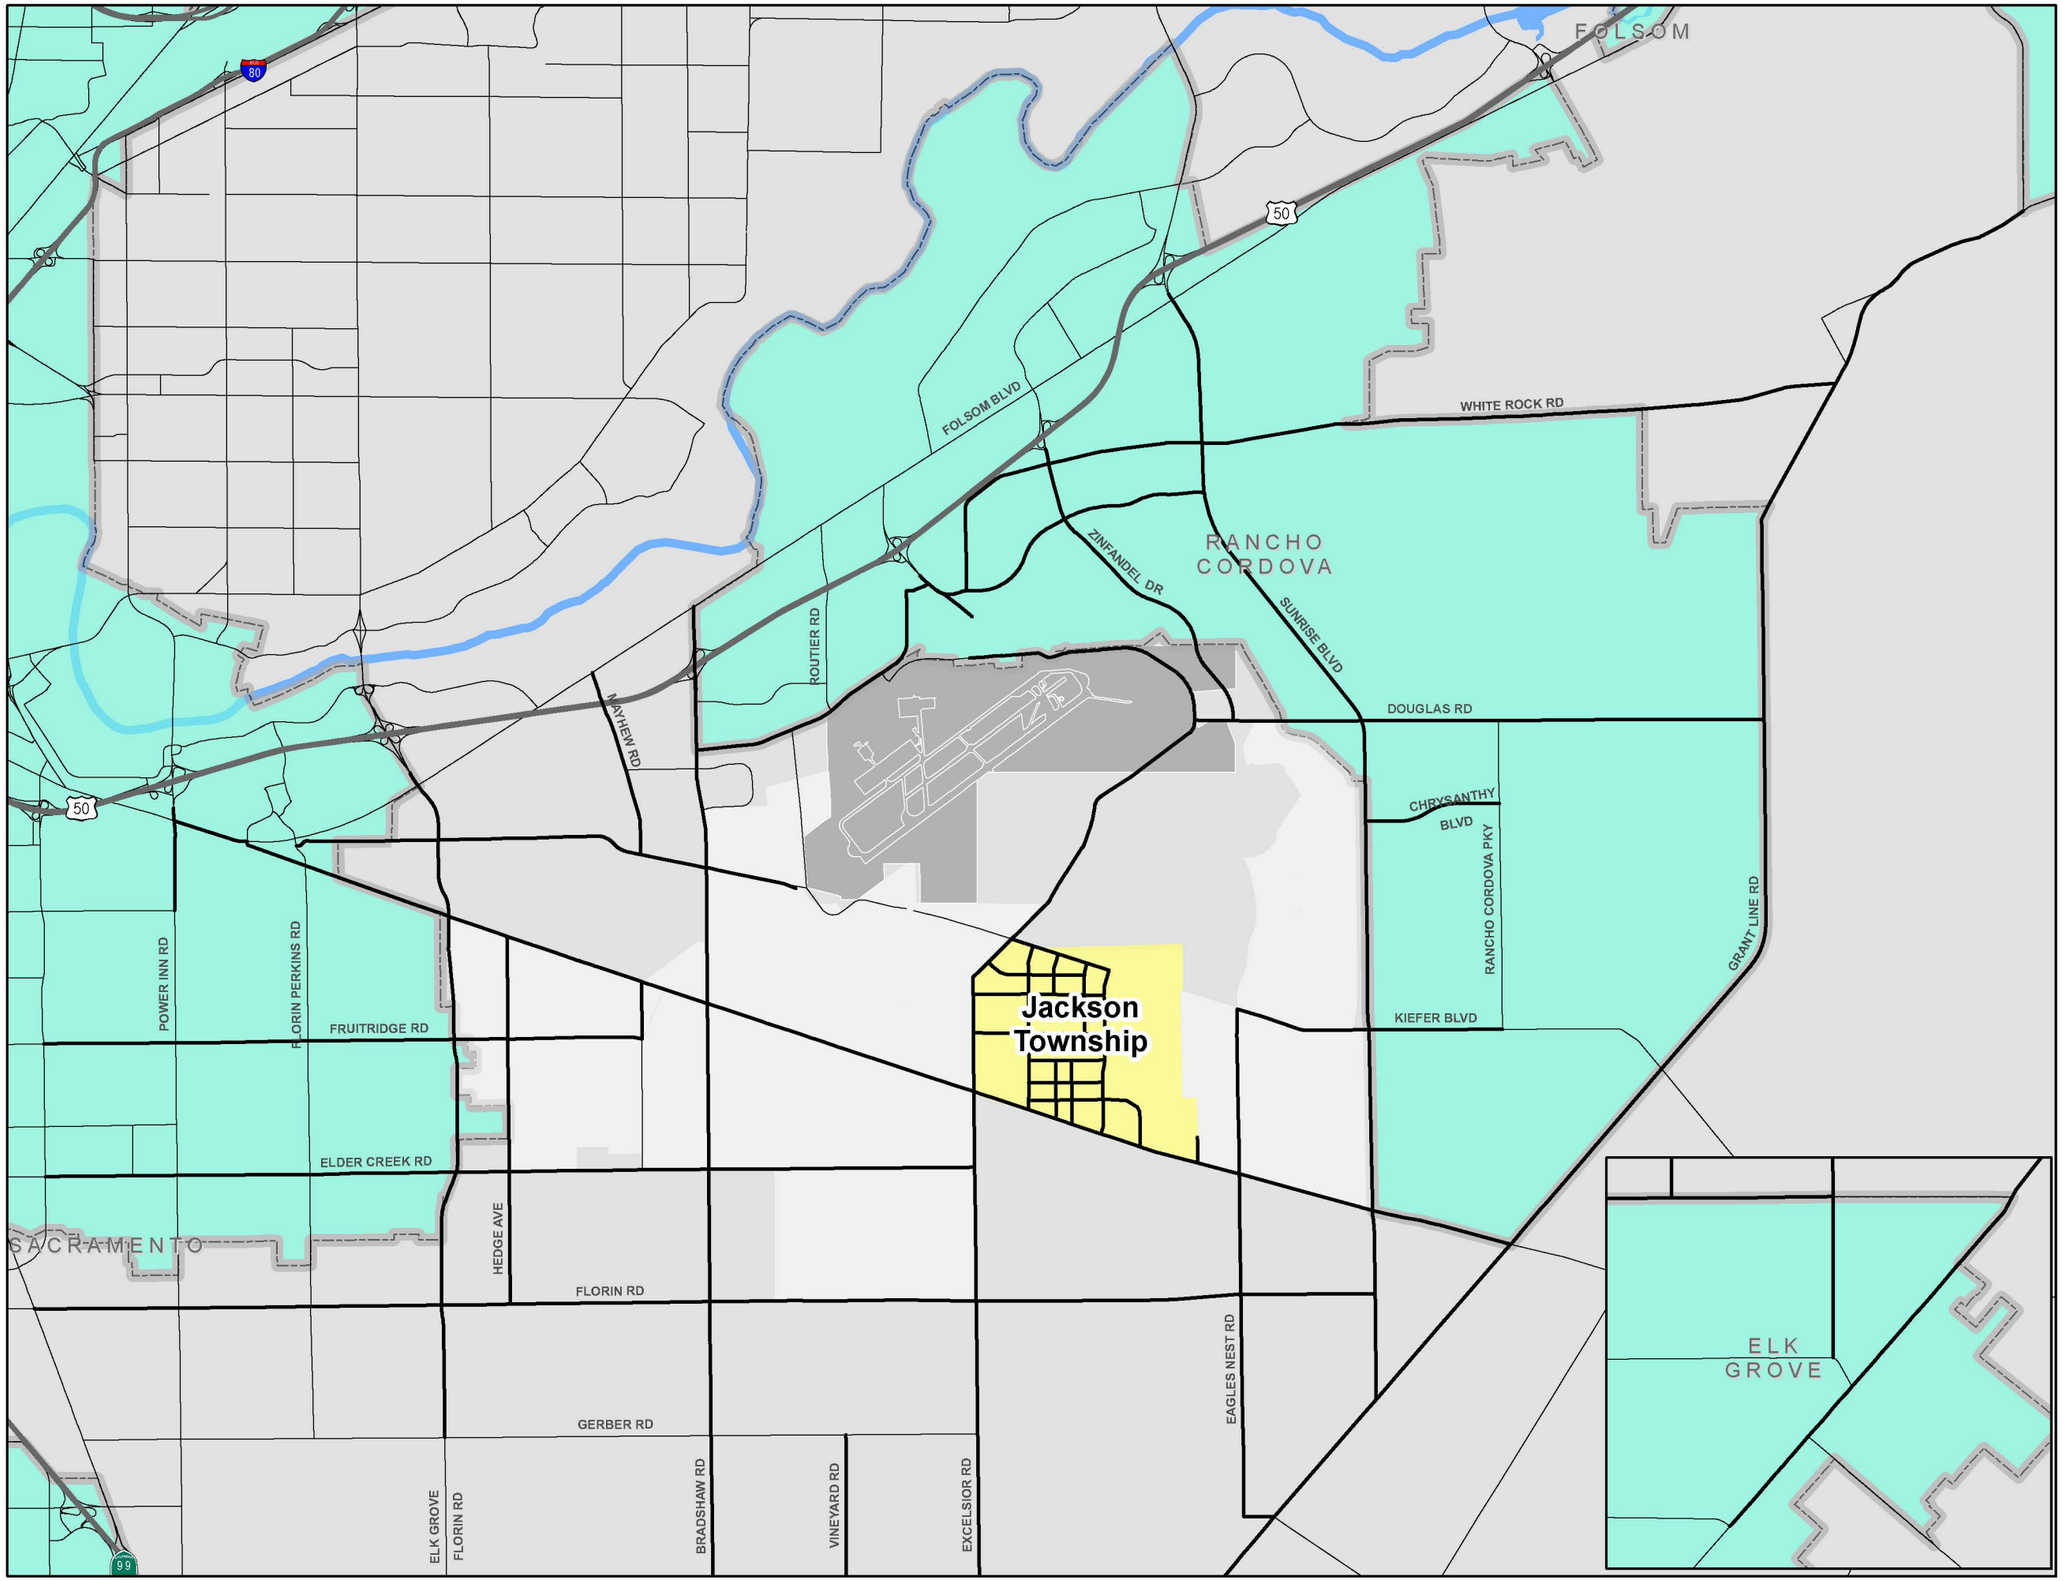
This transportation analysis discusses existing and cumulative transportation and circulation conditions associated with the implementation of the Jackson Township Specific Plan development. In addition, the report discusses the combined effects of implementing the following four developments (FOUR PROJECTS):

- West Jackson Highway Master Plan (West Jackson)
- Jackson Township Specific Plan (Jackson Township)
- NewBridge Specific Plan (NewBridge)
- Mather South Specific Plan Amendment (Mather South)

The FOUR PROJECTS are located adjacent to each other in the Jackson Road corridor. Because of this proximity and the concurrent entitlement process, the transportation analysis addresses the combined effects of the FOUR PROJECTS on existing and cumulative transportation and circulation conditions.

Figure 1.1 illustrates the location of the Jackson Township project. The Jackson Township project is located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the City of Rancho Cordova and Mather Airport. It is bounded on the south by Jackson Road (SR 16) and on the west by Excelsior Road. The north boundary is near the future Kiefer Boulevard, while the east boundary is west of Eagles Nest Road.

For more details of the West Jackson, NewBridge, and Mather South projects, please refer to Section 4.1.



Other development projects in the vicinity are included in the California Environmental Quality Act (CEQA) cumulative analysis scenarios and are discussed in Section 6.1.1.

The transportation analysis documented in this report includes consideration of vehicular traffic impacts on roadway and intersection capacity and safety, transit impacts, and bicycle and pedestrian facility impacts. Quantitative transportation analyses have been conducted for the following scenarios, summarized in **Table 1.1**:

- Existing (without FOUR PROJECTS)
- Existing Plus Jackson Township Project
- Existing Plus FOUR PROJECTS (West Jackson, Jackson Township, NewBridge, and Mather South developments)
- MTP Cumulative (without FOUR PROJECTS)
- MTP Cumulative Plus FOUR PROJECTS
- CEQA Cumulative (without FOUR PROJECTS)
- CEQA Cumulative Plus FOUR PROJECTS
- CEQA Cumulative Plus Jackson Township Project

The scenarios followed by the notation “(without FOUR PROJECTS)” contain no development, beyond existing levels, within the boundaries of the West Jackson, Jackson Township, NewBridge, and Mather South projects.

1.2 STUDY AREA

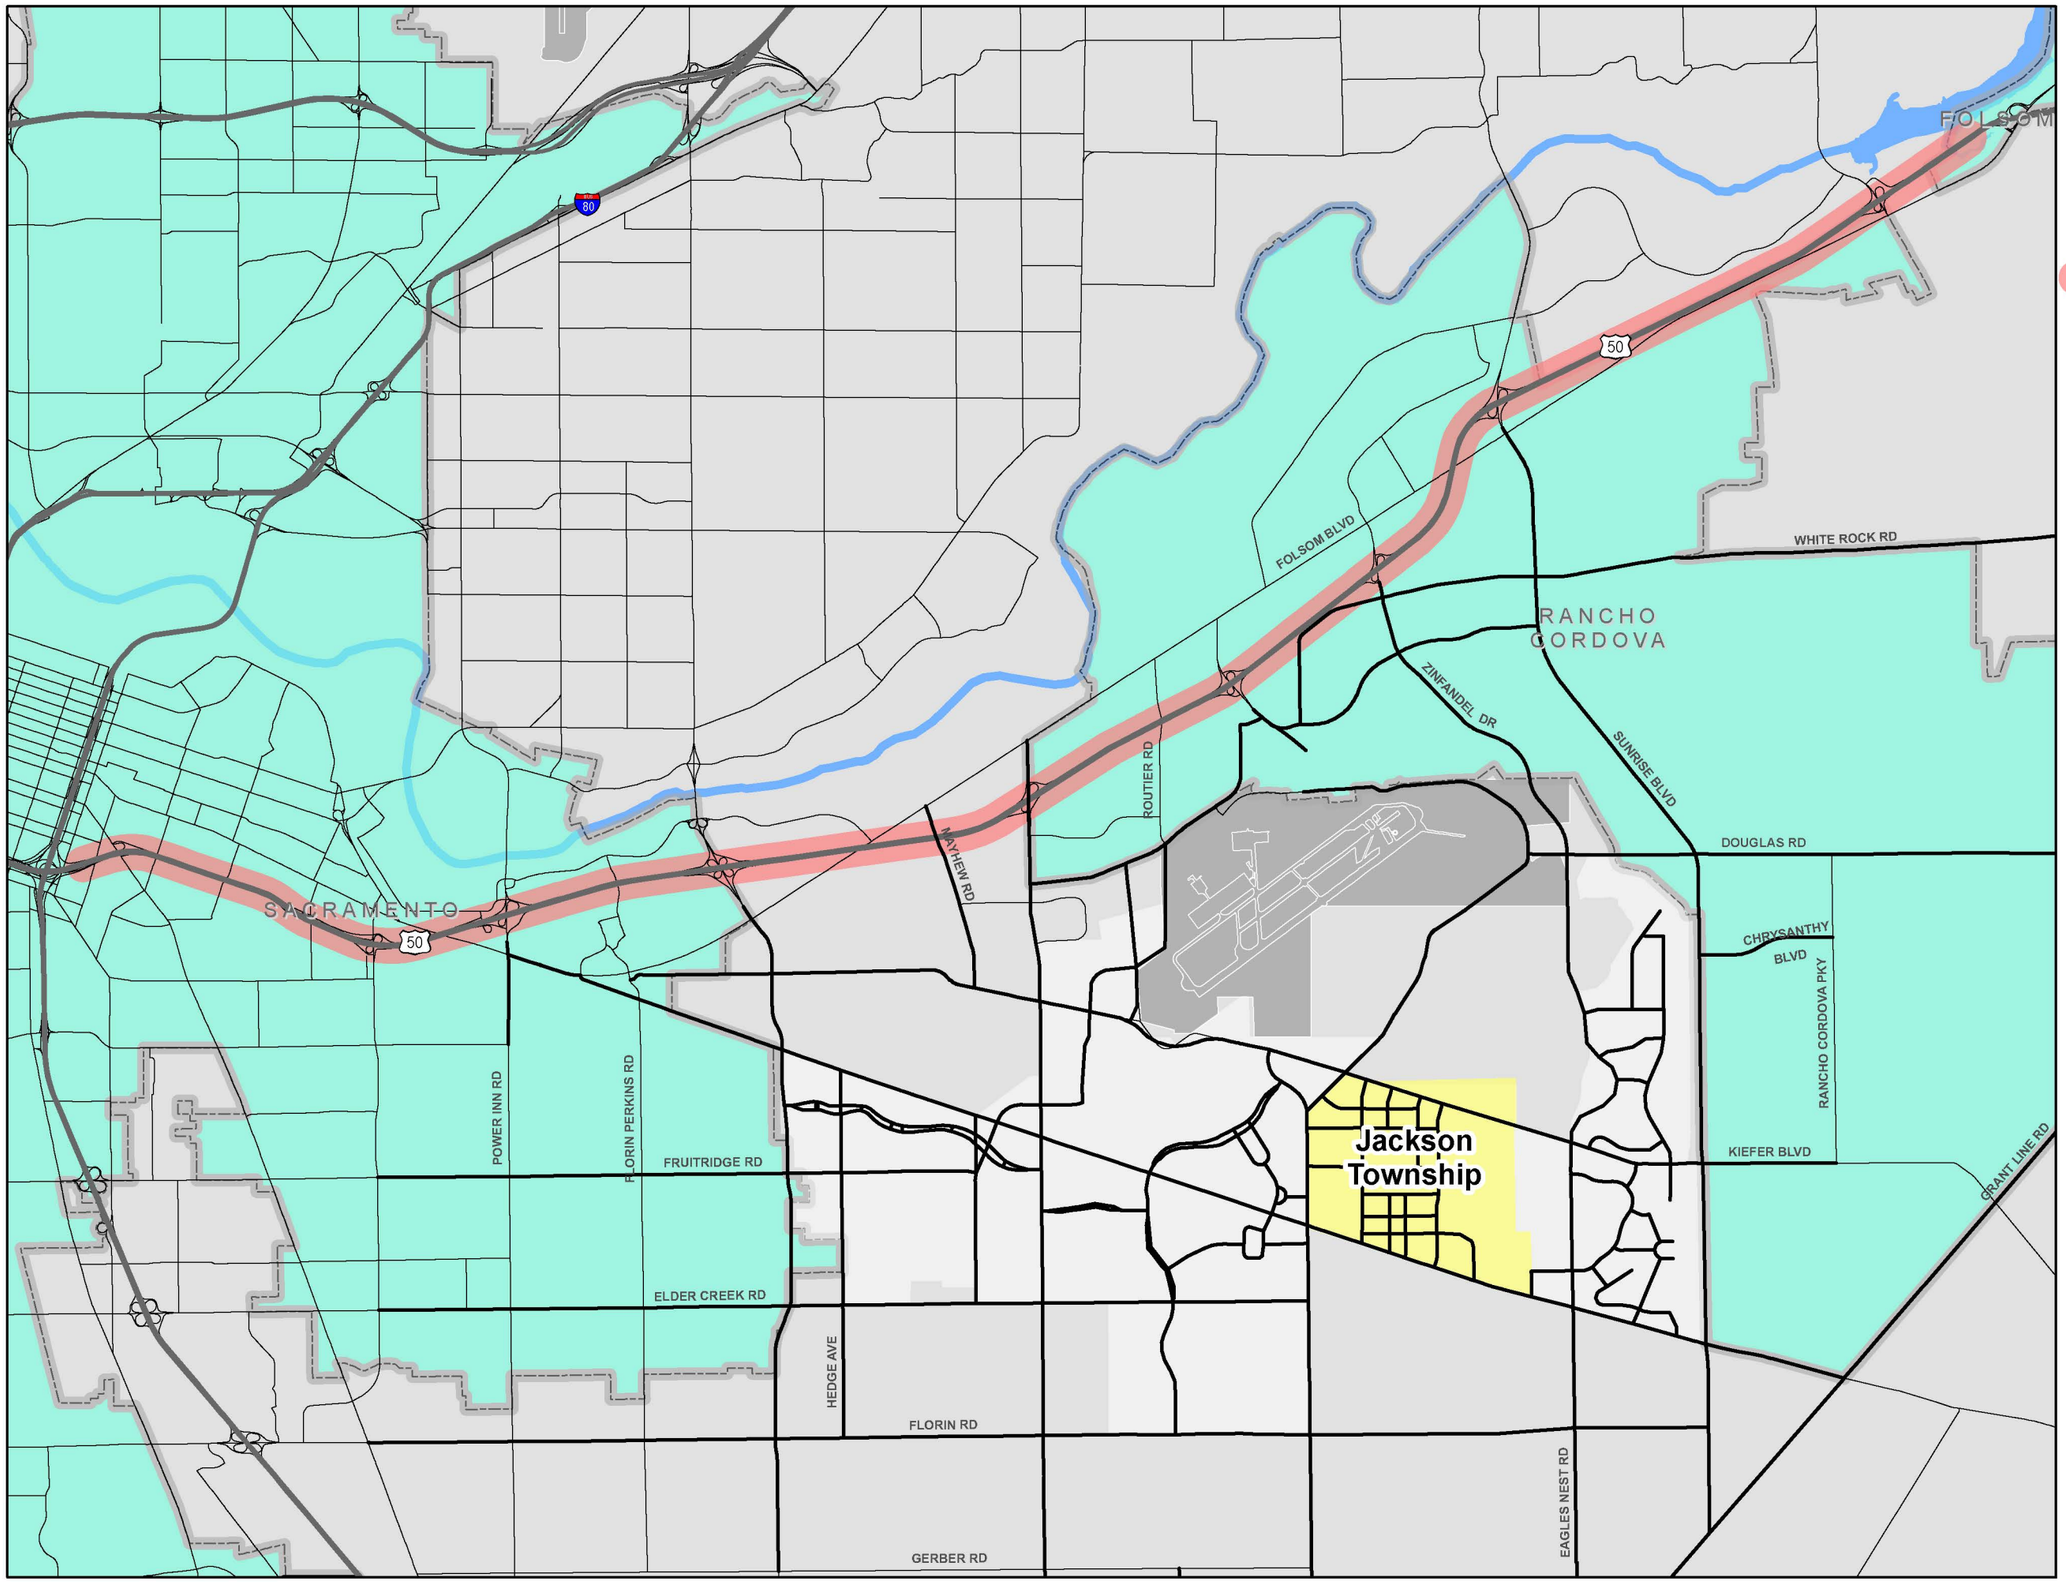
For transportation analysis purposes, a set of existing, proposed, and future intersections, roadway segments, and freeway facilities were selected based upon the anticipated volume of additional traffic, the distributional patterns of traffic, and known locations of operational difficulty. The Sacramento County Department of Transportation, Caltrans, City of Sacramento, City of Rancho Cordova, City of Elk Grove, City of Folsom, and Capital Southeast Corridor Joint Powers Authority were consulted. **Figures 1.2 through 1.4** illustrate the study area, which was agreed to by all of the above jurisdictions and agencies.

1.3 ANALYSIS METHODOLOGY

1.3.1 Forecasting

In this transportation analysis, the forecasting of travel patterns and volumes for each of the scenarios was developed through utilization of the Sacramento Area Council of Governments' (SACOG's) SACSIM travel model. SACSIM is an "activity-based" model that tracks the travel of individuals throughout the day in trip "tours", and allocates household and employment to the parcel level. This allows the model to capture smaller-scale land use changes and differences. SACSIM is sensitive to the local physical environment, including the presence (or absence) of pedestrian and bicycle facilities, the patterns of local street networks (e.g., grid vs. cul-de-sacs), and the density, proximity and mix of surrounding land uses (i.e. employment destinations, schools, retail, parks, etc.). SACSIM forecasts automobile, transit, bicycle, and walk trips. SACSIM requires a detailed definition of household population/demographics and employment by type at a parcel-level of geography. During the analysis, SACOG staff assisted in developing household population and demographics within the study area, and was consulted to ensure consistency with the latest and most appropriate modeling procedures and databases.

1.3.2 Operations Analysis



Field reconnaissance was undertaken to ascertain the traffic control and capacity characteristics of each of the study area intersections, roadway segments, and freeway elements. Combined with known or projected traffic volumes, these characteristics enable the calculation of performance measures. Levels of service are a quantitative stratification of performance measures that represent quality of service. There are six levels of service, ranging from A to F. LOS A represents the best operating conditions from the traveler's perspective and LOS F the worst. The specific performance measures that define LOS vary by type of transportation facility, and are discussed in the following sections.

1.3.2.1 Roadway Segment Analysis

Level of service analyses were conducted for roadway segments in the study area based upon daily traffic volumes, number of traffic lanes between intersections, and roadway characteristics. In this methodology, study area roadways are stratified into "capacity class" categories for level of service determination, as shown in **Tables 1.2, 1.3 and 1.4**, for Sacramento County and the City of Sacramento, respectively. The Sacramento County criteria were also utilized for segments in the City of Rancho Cordova and City of Elk Grove, as these jurisdictions utilize the same roadway segment level of service criteria.

The capacity class categories are based upon the nature of traffic flow along the facility, including number of interruptions due to intersection control and "side-friction" due to driveways and local streets. For each capacity class, relationships were developed between daily traffic volumes and roadway level of service.

Tables 1.2 and 1.3 summarize the maximum daily traffic volumes associated with each level of service designation and capacity class combination. Although the segment-based level of service calculations are based upon daily traffic volumes, the resultant levels of service are representative of peak hour conditions. While a roadway segment's daily capacity could theoretically be very high if traffic were spread evenly throughout the 24-hour period, this is clearly not a realistic condition. The daily roadway segment capacity methodology takes into account typical peak hour volume profiles, as well as the effects of signalized intersections in reducing the roadway's carrying capacity. With good signal timing, spacing, and additional intersection capacity improvements (e.g. additional turn lanes, overlap phasing), a segment would be able to carry more vehicles than one having less-than-ideal intersection conditions.

1.3.2.2 Intersection Analysis

For signalized and unsignalized intersections, operational analyses were conducted using a methodology outlined in the Transportation Research Board's *Highway Capacity Manual, 2000* (HCM 2000) and *Highway Capacity Manual, 2010* (HCM 2010). The HCM 2010 methodology was used in all locations except where signalized intersection characteristics deemed the methodology inappropriate. These locations include intersections with unconventional signal phasing, and locations adjacent to light rail tracks where additional delay occurs due to light rail operations. In the selected locations, the HCM 2000 methodology was employed.

The methodology utilized is known as an "operational analysis". This procedure calculates an average control delay per vehicle for each movement at an intersection, and assigns a level of service designation based upon the average delay per vehicle. **Table 1.5** presents the level of service criteria for signalized and unsignalized intersections based on the HCM methodology.

Table 1.2: Daily Volume Threshold For Roadway Segments (Sacramento County)						
Roadway Capacity Class	**Number of Lanes**	**Daily Volume Threshold (Level of Service)**				
		LOS A	**LOS B**	**LOS C**	**LOS D**	**LOS E**
Residential	2	600	1,200	2,000	3,000	4,500

1.3.2.3 Traffic Signal Warrant Analysis

Traffic signals are valuable devices for the control of motor vehicle, pedestrian, and bicycle traffic. However, because they assign the right-of-way to the various traffic movements, signals exert a profound influence on traffic flow. Properly located and operated control signals may provide for the orderly movement of traffic (motor vehicle, pedestrian, and bicycle), increase the traffic-handling capacity of an intersection, and reduce the frequency of certain types of crashes. After extensive study and analysis, the Federal Highway Administration and Caltrans developed traffic signal warrants. These warrants define minimum conditions under which signal installations may be justified. Traffic control signals should not be installed unless one or more of the signal warrants are met. However, the satisfaction of a warrant or warrants is not in itself justification for a signal. Every situation is unique and warrant guidelines must be supplemented by the review of specific site conditions and the application of good engineering judgment. Installation of a traffic signal should improve the overall safety and/or operation of an intersection and should be considered only when deemed necessary by careful traffic analysis and after less restrictive solutions have been attempted.

1.3.2.4 Freeway Analysis

Freeway mainline segments, ramp junctions, and weaving segments were analyzed utilizing methodologies outlined in the HCM 2010. **Table 1.6** presents the level of service criteria for the freeway mainline, freeway ramp junctions, and freeway weaving segments.

1.4 LEVEL OF SERVICE POLICIES

For analysis purposes, each of the study area roadway segments, intersections, and freeway elements was assigned to a particular jurisdiction (County of Sacramento, City of Sacramento, City of Rancho Cordova, City of Elk Grove, City of Folsom, or Caltrans) for purposes of specifying acceptable traffic operating conditions (level of service) and standards of significance for impact determination. In cases where transportation elements are located on a jurisdictional boundary, the more conservative (e.g., LOS D rather than LOS E) policy was utilized.

1.4.1 County of Sacramento

The County of Sacramento has the following level of service policy:

> *Plan and design the roadway system in a manner that meets Level of Service (LOS) D on rural roadways and LOS E on urban roadways, unless it is infeasible to implement project alternatives or mitigation measures that would achieve LOS D on rural roadways or LOS E on urban roadways. The urban areas are those areas within the Urban Service Boundary as shown in the Land Use Element of the Sacramento County General Plan. The areas outside the Urban Service Boundary are considered rural.*[1]

1 Sacramento County General Plan, amended November 9, 2011, Circulation Element Policy CI-9.

Table 1.6: Level of Service Criteria (Freeway)			
Level of Service (LOS)	**Maximum Density (Passenger Cars Per Mile Per Lane)**		
	Mainline	**Ramp Junctions**	**Weaving Segments**
A	≤ 11	≤ 10	≤ 10
B	> 11 and ≤ 18	> 10 and ≤ 20	> 10 and ≤ 20
C	> 18 and ≤ 26	> 20 and ≤ 28	> 20 and ≤ 28
D	> 26 and ≤ 35	> 28 and ≤ 35	> 28 and ≤ 35
E	> 35 and ≤ 45	> 35	> 35
F	> 45	Demand Exceeds Capacity	Demand Exceeds Capacity
Source: *HCM 2010 Highway Capacity Manual, Transportation Research Board, Washington, D.C., 2010.*			

The county roadway segments and intersections in the study area are located within the Urban Service Boundary. Therefore, the LOS E standard applies.

1.4.2 City of Sacramento

The Mobility Element of the City of Sacramento 2030 General Plan outlines goals and policies that coordinate the transportation and circulation system with planned land uses. The City of Sacramento has the following level of service policy relevant to this study:

> ***Policy M 1.2.2 LOS Standard.*** *The City shall allow for flexible Level of Service (LOS) standards, which will permit increased densities and mix of uses to increase transit ridership, biking, and walking, which decreases auto travel, thereby reducing air pollution, energy consumption, and greenhouse gas emissions.*
>
> …
>
> *b.* ***Level of Service Standard for Multi-Modal Districts*** *– The City shall seek to maintain the following standards in the Central Business District, in areas within ½ mile walking distance of light rail stations, and in areas designated for urban scale development (Urban Centers, Urban Corridors, and Urban Neighborhoods as designated in the Land Use and Urban Form Diagram). These areas are characterized by frequent transit service, enhanced pedestrian and bicycle systems, a mix of uses, and higher density development.*
>
> - *Maintain operations on all roadways and intersections at LOS A-E at all times, including peak travel times, unless maintaining this LOS would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. LOS F conditions may be acceptable, provided that provisions are made to improve the overall system and/or promote non-vehicular transportation and transit as part of a development project or a City-initiated project.*
>
> *c.* ***Base Level of Service Standard*** *– the City shall seek to maintain the following standards for all areas outside of multi-modal districts.*
>
> - *Maintain operations on all roadways and intersections at LOS A-D at all times, including peak travel times, unless maintaining this LOS would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. LOS E or F conditions may be accepted, provided that provisions are made to improve the overall system and/or promote non-vehicular transportation as part of a development project or a City-initiated project.*

d. ***Roadways Exempt from Level of Service Standard*** *– The above LOS standards shall apply to all roads, intersections, or interchanges within the City except as specified below. If a Traffic Study is prepared and identifies a significant LOS impact to a roadway or intersection that is located within one of the roadway corridors described below, the project would not be required in that particular instance to widen roadways in order for the City to find project conformance with the General Plan. Instead, General Plan conformance could still be found if the project provides improvements to other parts of the city wide transportation system in order to improve transportation-system-wide roadway capacity, to make intersection improvements, or to enhance non-auto travel modes in furtherance of the General Plan goals. The improvements would be required within the project site vicinity or within the area affected by the project's vehicular traffic impacts. With the provision of such other transportation infrastructure improvements, the project would not be required to provide any mitigation for vehicular traffic impacts to the listed road segment in order to conform to the General Plan.*

1.4.3 City of Rancho Cordova

The City General Plan Circulation Element has the following level of service policy:

> ***Policy C.1.2*** *- Seek to maintain operations on all roadways and intersections at Level of Service D or better at all times, including peak travel times, unless maintaining this Level of Service would, in the City's judgment, be infeasible and / or conflict with the achievement of other goals. Congestion in excess of Level of Service D may be accepted in these cases, provided that provisions are made to improve traffic flow and / or promote non-vehicular transportation as part of a development project of a City-initiated project.*[3]

1.4.4 City of Elk Grove

The City General Plan Circulation Element has the following level of service policy:

> ***CI-13*** *- The City shall require that all roadways and intersections in Elk Grove operate at a minimum Level of Service "D" at all times.*[4]

1.4.5 City of Folsom

Policy 17.17 of the City of Folsom General Plan identifies the minimum acceptable level of service for traffic operations in the City. Specifically, this policy states:

> *The City should strive to achieve at least a traffic Level of Service 'C' throughout the City.*[5]

As part of the Folsom South of U.S. Highway 50 Specific Plan, the level of service policy for the portion of the City of Folsom to be located south of US 50 is amended as follows:

> *The City should strive to achieve at least a traffic Level of Service "C" within the Folsom South of US 50 Specific Plan. For roadways and intersections within the Specific Plan, LOS "D" conditions may be considered on a case by case basis if improvements required to meet LOS "C" exceeds the "normally accepted maximum" improvements established by the City.*[6]

2 Sacramento 2030 General Plan, Master Environmental Impact Report, Certified March 3, 2009.
3 City of Rancho Cordova General Plan Circulation Element, June 26, 2006.
4 Elk Grove General Plan Circulation Element, Adopted November 19, 2003, Reflects Amendments through July 22, 2009.
5 City of Folsom General Plan, 1993.
6 Folsom South of U.S. Highway 50 Specific Plan DEIR/DEIS, June 2010.

1.4.6 Caltrans

The standards for Caltrans' facilities in the study area are detailed in the U.S. 50 Corridor System Management Plan (CSMP)[7]. Typical Concept LOS standards in Caltrans District 3 are LOS "D" in rural areas and LOS "E" in urban areas. The 20-Year Concept LOS for U.S. 50 in the study area is LOS F, because improvements necessary to improve the LOS to E are not feasible due to environmental, right-of-way, financial, and other constraints. Although the US 50 CSMP allows LOS F, standards of significance hold that any increase in mainline volume greater than 5% would constitute an impact.

1.4.7 Capital SouthEast Connector Joint Powers Authority (Connector JPA)

The Capital SouthEast Connector Joint Powers Authority (JPA) was formed in December 2006 and includes the cities of Elk Grove, Folsom and Rancho Cordova, and El Dorado and Sacramento Counties. Under a policy set forth by the JPA, signalized intersections along the Connector facility are required to operate at level of service "C" or better (with LOS "D" being allowed in the Sheldon area). The Connector JPA's intersection LOS policy does not apply to roadway segments.

1.5 SIGNIFICANCE CRITERIA

In accordance with CEQA, the effects of a project are evaluated to determine if they will result in a significant adverse impact on the environment. The standards of significance in this analysis are based upon current practice of the appropriate regulatory agencies.

1.5.1 Roadways Segments and Intersections

Table 1.7 summarizes the significance criteria for intersections and roadway segments for Sacramento County, the City of Sacramento, the City of Rancho Cordova, the City of Elk Grove, and the City of Folsom.

1.5.2 Freeway Facilities

Caltrans considers the following to be significant impacts:

- Off-ramps with vehicle queues that extend into the ramp's deceleration area or onto the freeway.

- Project traffic increases that cause any ramp's merge / diverge level of service to be worse than the freeway's level of service.

- Project traffic increases that cause the freeway level of service to deteriorate beyond level of service threshold defined in the Caltrans Route Concept Report for the facility.

7 Highway 50 Corridor System Management Plan, May 2009.

- The expected ramp queue is greater than the storage capacity.

Further, it is Caltrans' position that on segments of the SHS main line where the existing LOS is at or below the Concept LOS, any land use development should not directly or cumulatively lower the existing LOS and/or increase the V/C ratio now or in the future on the identified highway segments by 5 percent or greater. Any impacts exceeding this 5 percent threshold will be viewed by Caltrans as significant and warrant appropriate mitigation.

Table 1.7: Level of Service Standards and Thresholds of Significance						
Jurisdiction	**Area**	**LOS Policy**	**Thresholds of Significance**			**Notes**
			Signalized Intersection	**Unsignalized Intersection**	**Roadway Segment**	
County of Sacramento	Inside Urban Service Boundary	E	> 5 seconds (intersection average)	> 5 seconds (movement / approach) and meet traffic signal warrant	> .05 V/C	
	Outside Urban Service Boundary	D				
City of Sacramento	Base	D	≥ 5 seconds (intersection average)		≥ .02 V/C	Deficient LOS may be accepted provided provisions are made to improve the overall system and / or promote non-vehicular transportation
	Exempt Areas	E / F				
City of Elk Grove	All	D	≥ 5 seconds (intersection average)		≥ .05 V/C	
City of Folsom	Base	C	≥ 5 seconds (intersection average)		Not Applicable	
	South of US 50 Specific Plan	D				
City of Rancho Cordova	All	D	> 5 seconds (intersection average)	> 5 seconds (movement / approach) and meet traffic signal warrant	> .05 V/C	
Connector JPA	Base	C	> 5 seconds (intersection average)	N/A	≥ .05 V/C	Roadway segments above capacity should be grade separated
	Sheldon	D		N/A	≥ .05 V/C	Roadway segments above capacity should be grade separated, unless both intersections operate acceptably

1.5.3 Bicycle and Pedestrian Facilities

Impacts to bicycle and pedestrian facilities are considered significant if the proposed project would:

- Eliminate or adversely affect an existing bikeway or pedestrian facility in a way that would discourage its use;
- Interfere with the implementation of a planned bikeway as shown in the Bicycle Master Plan, or be in conflict with the Pedestrian Master Plan; or
- Result in unsafe conditions for bicyclists or pedestrians, including unsafe bicycle / pedestrian, bicycle / motor vehicle, or pedestrian / motor vehicle conflict.

1.5.4 Transit

Impacts to the transit system are considered significant if the proposed project would:

- Adversely affect public transit operations; or,
- Fail to adequately provide access to transit.

1.5.5 Rural Roadway Functionality

Of specific concern in the study area of this project is the functionality of substandard rural roadways. The County's current rural roadway standard consists of two-twelve foot wide travel lanes and six-foot wide paved shoulders. Therefore, any rural roadway not fitting this definition can be considered substandard.

Many of the existing rural roadways in the study area have travel lanes as narrow as 10 feet wide with no roadside shoulders. These roadways were constructed many years ago and tended to serve as roadway connections between small towns and communities and to serve as farm to market roadways. While these narrow roadways have adequately served the travel demand of the historical past, they are not intended to serve the greater travel demands that nearby residential and commercial development may impose.

The County expects that the functionality of these roadways will change with nearby development, the increase in population, the introduction of various modes of travel in the study area, and the addition of project traffic on these substandard roadways. No longer will these roadways only serve farm to market and small communities. With these changes in functionality of the roadway comes the possibility of increased interactions between varying modes of travel (i.e. pedestrians, bicyclists, etc.) as well as the increased interaction between a greater number of vehicles on substandard roads.

General Plan Policy CI-1 states *Provide complete streets to provide safe and efficient access to a diversity of travel modes for all urban, suburban and rural land uses within Sacramento County. Within rural areas of the County, a complete street may be accommodated through roadway shoulders of sufficient width or other means to accommodate all modes of travel.*

General Plan Policy CI-7 states *Plan and construct transportation facilities as delineated on the Transportation Plan of the Sacramento County General Plan. Transportation facilities shall be consistent with the Sacramento County, Municipal Services Agency Improvement Standards…*

General Plan Policy CI-10 states *Land development projects shall be responsible to mitigate the project's adverse impacts to local and regional roadways.*

Therefore, the County has applied an impact standard to these substandard roadways as follows:

Impacts to substandard rural roadway functionality are considered significant if the proposed project would:

- Cause the substandard rural roadway to exceed an average daily traffic volume of 6,000 daily vehicles; or

- Add 600 or more new daily vehicle trips to a substandard rural roadway that already carries 6,000 or more daily vehicles.

Significant impacts shall be mitigated by requiring reconstruction of the substandard rural roadway to the County standard of 12-foot vehicle lanes with 6-foot paved shoulders.

1.6 DEVELOPMENT OF MITIGATION MEASURES

This transportation analysis includes the development of mitigation measures for those impacts that have been determined to exceed the level of service policies. Important considerations in the development of such mitigation measures are feasibility, consistency with the General Plan and secondary impacts. While most impacts could theoretically be mitigated by adding more traffic lanes, grade separations, new roadways, and other similar measures, such mitigation may not be consistent with public policy, and could result in secondary impacts to the environment and other users.

The Sacramento County General Plan Circulation Element provides guidance regarding the development of mitigation measures. In particular, the Circulation Element specifies the maximum number of through lanes for major County roadways. The General Plans of the other jurisdictions in the study area provide similar guidance. In general, for those impacts that exceed the level of service policies, mitigation measures have been developed for the widening of roadway segments to accommodate additional travel lanes up to the maximum number of lanes designated in the general plans.

Similarly, the County and other jurisdictions have typical intersection cross-sections. In general, on each approach to an intersection on a four-lane or six-lane roadway, the typical cross-section includes two left turn lanes, the appropriate number of through lanes (two or three), and a single right turn lane. Exceptions to the typical intersection geometry will be considered on a case-by-case basis and in special circumstances. Mitigation measures that exceed the typical intersection geometry will be noted as so.

In the development of mitigation measures, the number of roadway segment lanes and intersection lanes has been expanded, where appropriate, to reduce impacts. In most cases, the mitigation measure does not exceed the maximum number of roadway lanes identified in the General Plans nor exceeds the typical intersection geometry. In some cases, mitigation measures consistent with the General Plan and the typical intersection geometry may not reduce the impact consistent with the level of service policies. In these cases, an alternative mitigation measure may be considered that may necessitate an amendment to the County's General Plan or deviate from the typical intersection geometry. In other cases where the roadway is already constructed to the full General Plan designation or an intersection is already constructed to the standard intersection geometry and no alternative mitigation measure is feasible, no mitigation measure may be available to reduce the impacts.

1.7 HIGH CAPACITY INTERSECTIONS

The Sacramento County General Plan recognizes that at-grade intersections may not be able to accommodate all traffic demands along the County's busiest roadways. In selected locations, the General Plan designates High Capacity Intersections. A high capacity intersection would utilize special treatments to increase the capacity of the intersection to reduce congestion and travel delay. Since each intersection has unique travel movements, volumes and existing context sensitive conditions, the special treatments utilized at each high capacity intersection will vary to meet the specific needs of each intersection. The range of special treatments is quite wide, ranging from the restriction of certain turning movements to various combinations that could include grade separating certain movements. Special treatments such as the following could be utilized at a high capacity intersection:

- Restricting turning movements
- Median U-turns
- Roundabouts
- Split intersections
- Quadrant roadway intersections
- Bowtie intersections
- Directional flyovers
- Center turn overpass
- Grade separated roundabout
- Diverging diamond grade separation
- Compact diamond grade separation
- Single point urban grade separation
- Traditional urban grade separation

Implementation of a high capacity intersection treatment could result in secondary impacts, including right-of-way, pedestrian and bicycle impacts, restrictions to local access, fiscal, and many others. As there are many possible solutions that would provide an acceptable LOS at any location, each with related impacts, this transportation analysis cannot identify specific high capacity intersection solutions. While high capacity intersections could theoretically mitigate any of the identified LOS impacts, the feasibility of such measures has not been established at this time.

2. EXISTING CONDITIONS

2.1 ROADWAY SYSTEM

Figure 2.1 illustrates the existing roadway network.

2.1.1 Regional Access

Regional automobile access to the site is provided by the freeway system and by State Route 16.

U.S. Highway 50 (US 50) is an east-west freeway that extends from the Interstate 80 (I-80) junction in West Sacramento to Canal Street in the City of Placerville, where it continues as a highway across the Sierra Nevada to South Lake Tahoe and Nevada. Primary access to US 50 is via a series of interchanges, including (from west to east) Howe Avenue, Watt Avenue, Bradshaw Road, Mather Field Road, and Sunrise Boulevard. To the west, US 50 provides access to Central City Sacramento, SR 99, I-5, and I-80. To the east, US 50 provides access to eastern Sacramento County, the cities of Rancho Cordova and Folsom, and El Dorado County.

State Route 16 (SR 16) is a Caltrans facility. In the vicinity of the site, SR 16 is located on **Jackson Road**, which is the southern boundary of the Jackson Township project site. The roadway generally travels from west-northwest to east-southeast from Folsom Boulevard to the west into Amador County to the east. It is generally a two-lane roadway with some widening at intersections. To the west, SR 16 continues to US 50 via Folsom Boulevard and Howe Avenue in the City of Sacramento.

2.1.2 Local Access

Direct access to the site is provided primarily via Jackson Road, Excelsior Road, and the future Kiefer Boulevard.

Excelsior Road is a north-south roadway that forms the western boundary of the project site. To the north, Excelsior Road extends into the Independence at Mather community. Beyond the community, the roadway becomes Mather Boulevard. To the south, Excelsior Road extends to Sheldon Road in the City of Elk Grove. Excelsior Road is a two-lane roadway.

Kiefer Boulevard is an east-west roadway that crosses the northern portion of the Jackson Township project site. The roadway consists of two segments, divided by Mather Field. The western segment extends from Florin-Perkins Road in the City of Sacramento through the Rosemont community to Happy Lane. This segment has two to four through lanes. East of Mather Field, the roadway begins at Eagles Nest Road and continues easterly to Jackson Road as a two-lane roadway. The portion of Kiefer Boulevard that crosses the northern portion of the Jackson Township project site does not currently exist, and would be implemented as part of the Jackson Township project.

2.2 TRANSIT SYSTEM

The Sacramento Regional Transit District (RT) operates 67 bus routes and 38.6 miles of light rail covering a 418 square-mile service area. Buses and light rail run 365 days a year using 76 light rail vehicles, 182 buses (with an additional 30 buses in reserve) powered by compressed natural gas (CNG) and 11 shuttle vans. Buses operate daily from 5 a.m. to 11 p.m. every 12 to 75 minutes, depending on the route. Light rail trains begin operation at 4 a.m. with service every 15 minutes during the day and every 30 minutes in the evening and on weekends. Blue Line and Gold Line trains operate until 12:30 a.m. and the Gold Line to Folsom operates until 7 p.m. Green Line trains operate every 30 minutes Monday through Friday. Passenger amenities include 50 light rail stops or stations, 31 bus and light rail transfer centers and 18 park-and-ride lots. RT also serves over 3,300 bus stops throughout Sacramento County.[8]

Figure 2.2 illustrates selected RT service near the Jackson Township project site. The RT Gold Line light rail service is located parallel to Folsom Boulevard north of the Jackson Township project site. Nearby stations include (from west to east) Watt / Manlove, Starfire, Tiber, Butterfield, Mather Field / Mills, Zinfandel, Cordova Town Center, and Sunrise. No RT bus routes operate in the vicinity of the site.

2.3 BICYCLE SYSTEM

Figure 2.3 illustrates the Sacramento County Bikeway Master Plan in the vicinity of the Jackson Township project site, depicting existing and planned bikeways. A future Class I Bikeway, the Elder Creek Trail, crosses the southern portion of the site. Future Class II Bikeways are planned on Jackson Road, Excelsior Road, and Kiefer Boulevard.

2.4 PEDESTRIAN SYSTEM

The pedestrian sidewalk system is incomplete within the Jackson Township project site and in many areas in the vicinity of the Jackson Township project site. As development occurs, sidewalks are being installed along many roadways in the area. With the exception of those locations where such improvements have already occurred, pedestrian access in the immediate vicinity of the Jackson Township project is limited to roadway shoulders, where such shoulders exist.

2.5 TRAFFIC VOLUMES

Peak period (7:00 to 9:00 a.m. and 4:00 to 6:00 p.m.) intersection turning movement counts were collected on Tuesdays, Wednesdays, and Thursdays in April and Early May, 2013 for the existing intersections in the study area.

Daily (24-hour) segment counts were collected on Tuesdays, Wednesdays, and Thursdays in April and Early May, 2013 for the existing segments in the study area. The existing daily traffic volumes are summarized later in Section 2.6.1 of this report.

8 http://www.sacrt.com/rtataglance.stm Accessed 14 February 2014.

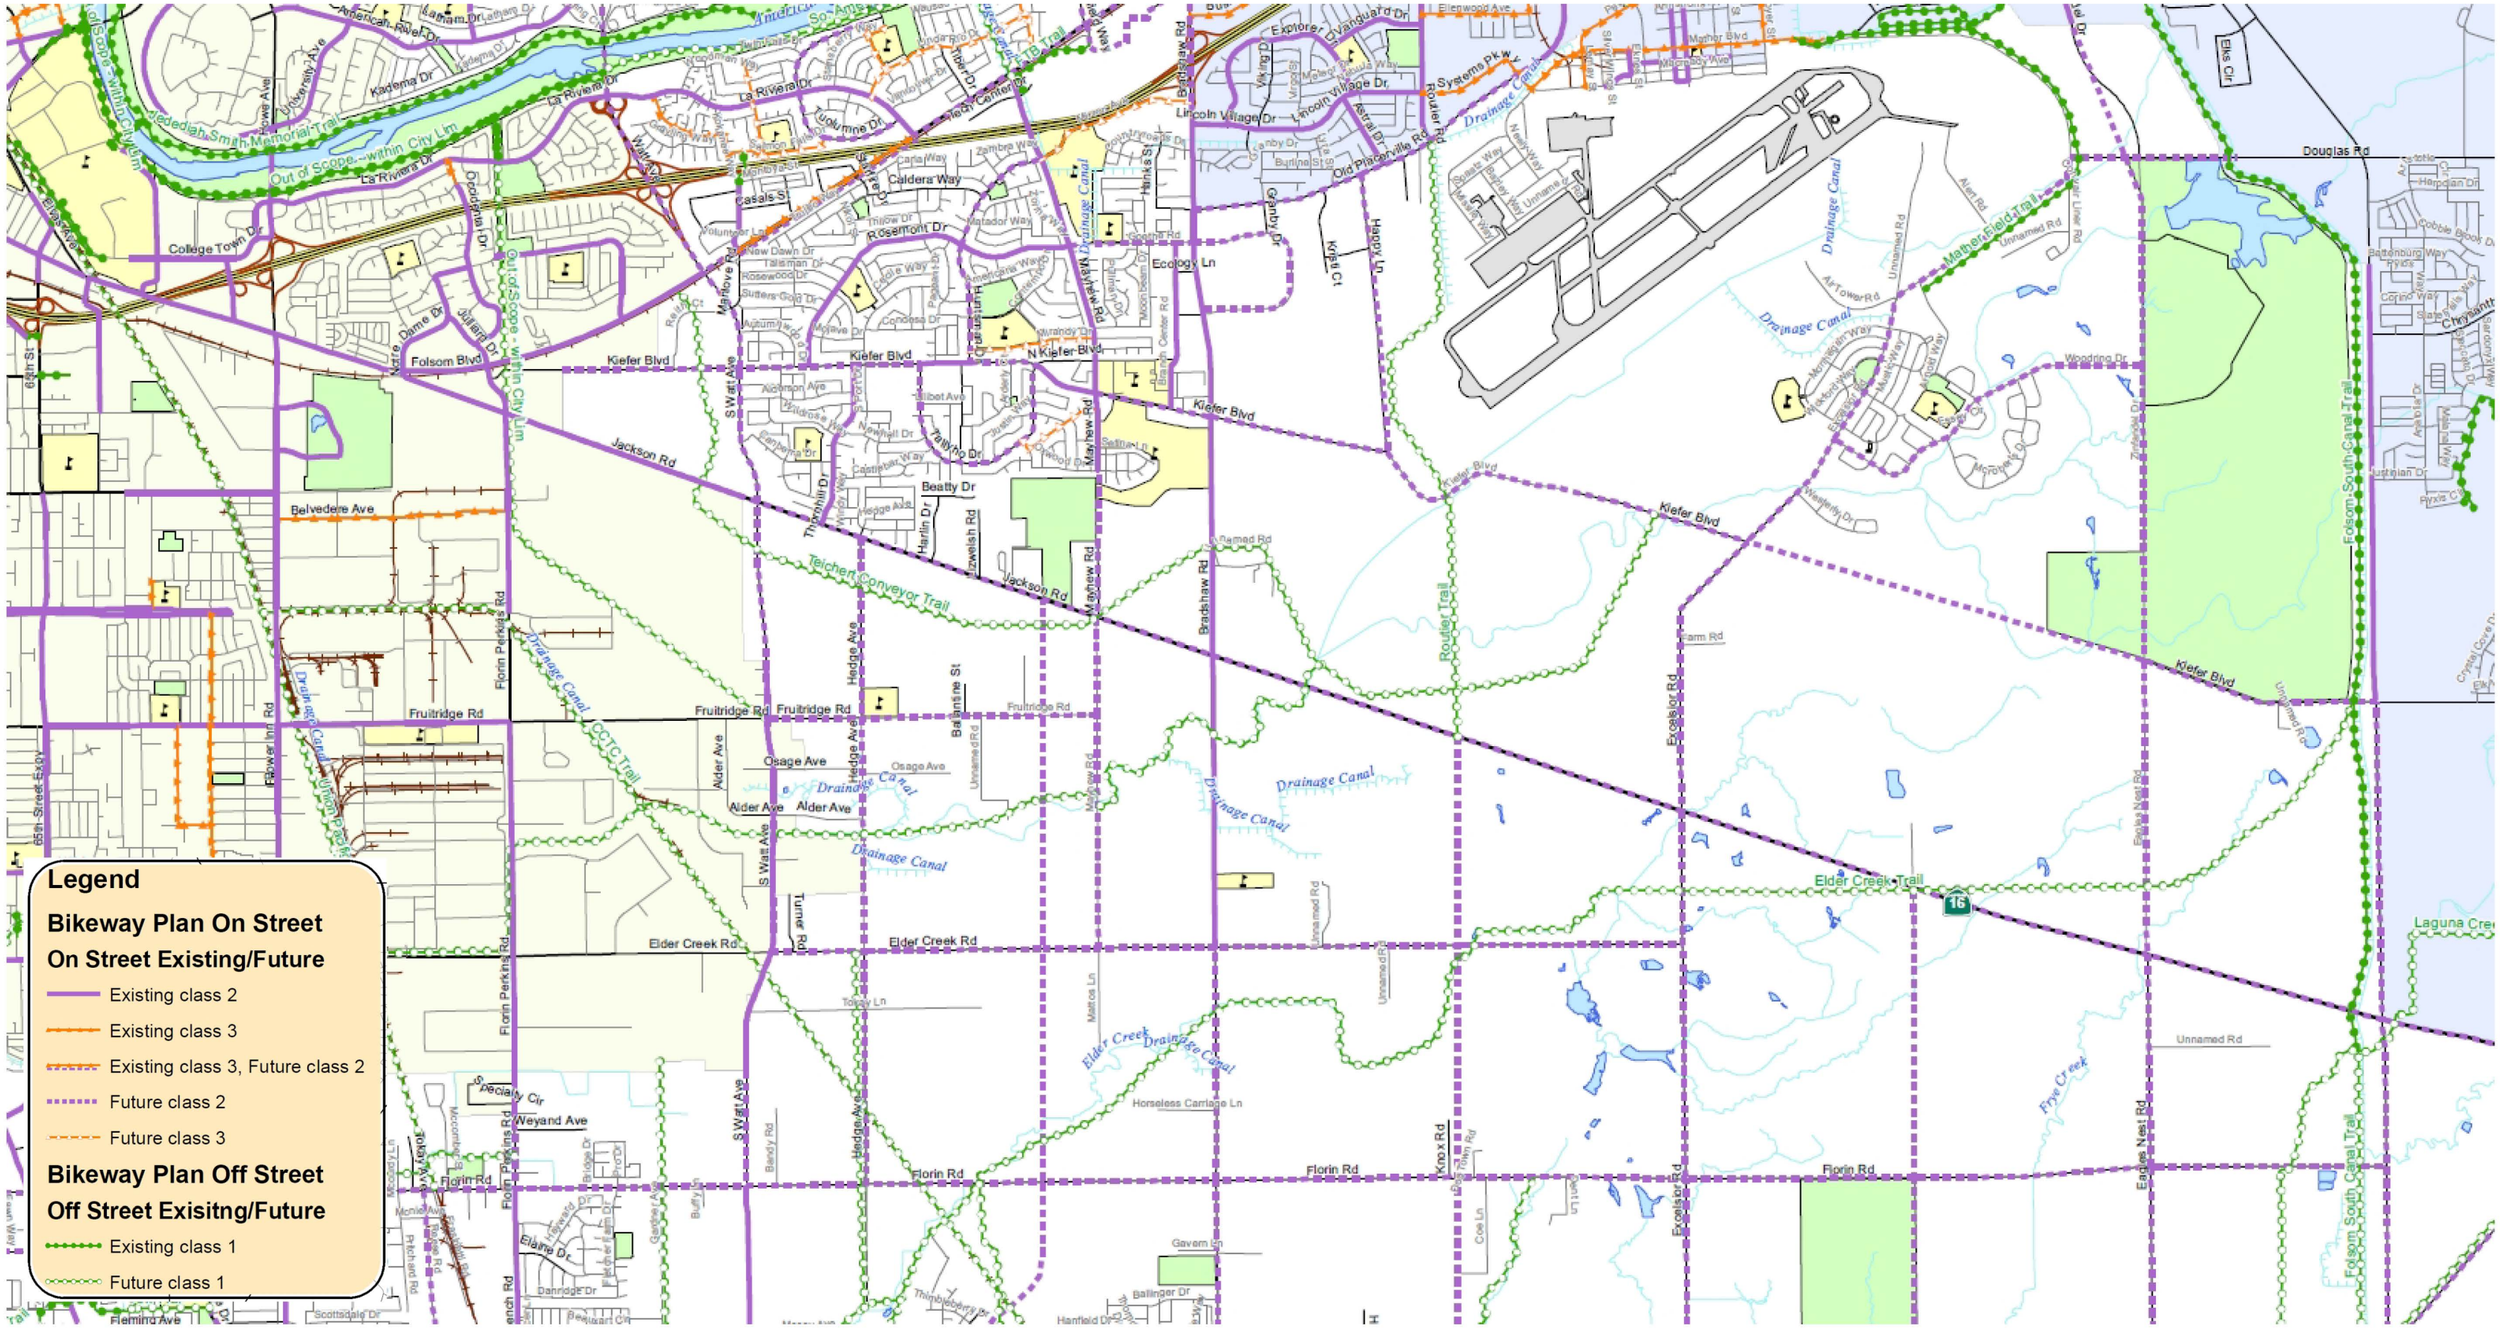

FIGURE 2.3
EXISTING BICYCLE NETWORK

Peak period traffic volumes on the US 50 freeway system (mainline and ramps) were obtained from the California Freeway Performance Measurement System (PeMS). Data recorded on April 16 through 18, 2013, and April 23 through 25, 2013 were utilized in these analyses.

2.6 EXISTING OPERATING CONDITIONS

Figure 2.4 summarizes existing roadway operating conditions.

2.6.1 Roadway Segments

Level of service analyses were also conducted for the roadway segments in the study area based upon daily traffic volumes, number of traffic lanes between intersections, and roadway characteristics. **Table 2.1** summarizes the roadway levels of service, and the performance of the segment compared to the level of service policies of the assigned jurisdiction.

The following segments do not meet the level of service policies:

- Bradshaw Road - US 50 to Lincoln Village Drive
- Elk Grove Florin Road - Florin Road to Gerber Road
- Folsom Boulevard - Howe Avenue to Jackson Road
- Grant Line Road - Calvine Road to Bond Road
- South Watt Avenue - Jackson Road to Florin Road
- Sunrise Boulevard - US 50 to Trade Center Drive
- Sunrise Boulevard - Kiefer Boulevard to Jackson Road
- Watt Avenue - US 50 to Folsom Boulevard

2.6.2 Intersections

Existing intersection geometry (number of approach lanes) is illustrated in the tables below.

Table 2.2 summarizes the existing a.m. and p.m. peak hour operating conditions at the study area intersections, and the performance of the segment compared to the level of service policies of the assigned jurisdiction. At two-way stop unsignalized intersections, Sacramento County determines conformity with the level of service policy on an approach / movement basis, while the City of Sacramento utilizes a calculation of the average intersection level of service (similar to signalized intersections and all-way stop intersections). Details of the intersection operating condition calculations are included in the technical appendix.

Table 2.1
Existing Roadway Segment Levels of Service

ID	Roadway	Segment		Jurisdiction	Governing Jurisdiction / Area[1]	LOS Policy Criteria	Existing				
		From	To				Travel Lanes	Facility Type[1]	Daily Volume	Volume / Capacity Ratio	Level of Service

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy.

[1] The following classifications are used to determine the applicable LOS Policy:
County Rural - Sacramento County, Outside Urban Service Boundary
County Urban - Sacramento County, Within Urban Service Boundary
City Default - City of Sacramento, Base Level of Service Standard
City Exempt Roadway - City of Sacramento, Roadways Exempt from Base Level of Service Standard
City Exempt Light Rail - City of Sacramento, Within 1/2 Mile Walking Distance of Light Rail Station

Bold values do not meet LOS policy.

The following intersections do not meet the level of service policies:

- South Watt Avenue and Elder Creek Road - a.m. and p.m. peak hours
- Bradshaw Road and Folsom Boulevard - a.m. peak hour
- Happy Lane and Old Placerville Road - northbound left turn - a.m. and p.m. peak hours
- Mather Field Road and Rockingham Drive - a.m. peak hour
- Zinfandel Drive and US 50 Eastbound Ramps / Gold Center Drive - p.m. peak hour
- Sunrise Boulevard and Jackson Road - a.m. peak hour
- Grant Line Road and Jackson Road - a.m. and p.m. peak hours
- Grant Line Road and Wilton Road - a.m. and p.m. peak hours

2.6.3 U.S. 50 Freeway

2.6.3.1 Freeway Mainline

Table 2.3 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. The following locations exhibit LOS F conditions:

- Eastbound
    - Stockton Boulevard to 59th Street - a.m. and p.m. peak hours
    - Bradshaw Road to Mather Field Road - a.m. peak hour
    - Zinfandel Drive to Hazel Avenue - p.m. peak hour
- Westbound
    - Mather Field Road to Watt Avenue - a.m. peak hour
    - Watt Avenue to 59th Street - a.m. and p.m. peak hours
    - 59th Street to SR 51 / SR 99 - p.m. peak hour

2.6.3.2 Freeway Ramp Junctions / Weaving

Table 2.4 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit LOS F conditions:

- Eastbound
    - Watt Avenue Entrance Merge - a.m. peak hour
    - Mather Field Road to Zinfandel Drive weave - a.m. peak hour
- Westbound
    - Sunrise Boulevard Entrance - a.m. peak hour

2.6.3.3 Freeway Ramp Intersection Queuing

Table 2.5 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. None of the existing queues extends onto the freeway mainline.

2.6.4 Rural Roadway Functionality

Figure 2.5 shows rural roadway segments that currently do not meet the County standard of 12-foot vehicle lanes with 6-foot paved shoulders. Sacramento County is currently the only jurisdiction that has policies regarding the functionality of rural roadways, therefore the functionality of rural roadways in other jurisdictions was not considered in the traffic study. **Table 2.6** summarizes substandard County rural roadways in the study area.

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

3. EXISTING PLUS JACKSON TOWNSHIP PROJECT (ALTERNATIVE 2)

3.1 JACKSON TOWNSHIP PROJECT (ALTERNATIVE 2) DESCRIPTION

As illustrated previously in Figure 1.1, the Jackson Township project is located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the City of Rancho Cordova and Mather Airport. It is bounded on the south by Jackson Road (SR 16) and on the west by Excelsior Road. The north boundary is near the future Kiefer Boulevard, while the east boundary is west of Eagles Nest Road.

3.1.1 Land Use

Table 3.1 summarizes the Jackson Township land use for Alternative 2. The SACSIM model (used to estimate travel demand by travel mode) requires estimates of the number and demographics of people who would live in each household as well as key social/economic characteristics of each household. SACOG helped estimate the required household demographics based on the number housing units by density category and detailed local Census data compiled by housing types.

SACSIM also requires employment by type for each parcel in the Jackson Township project. The applicant provided number of acres and square feet by non-residential category on each parcel. Employment estimates were then estimated using average square feet per employee and per student. The total employment in Jackson Township (Alt. 2) was estimated to be about 5,833.

The model also requires the estimated enrollment at each school within the Jackson Township project. The total enrollment for grades K-12 was estimated at about 6,000 students. Some of those students would come from housing units outside the Jackson Township project.

3.1.2 Transportation Network

3.1.2.1 Roadway Segments and Intersections

Figure 3.1 illustrates the Jackson Township project transportation network. The Jackson Township project would widen and / or complete many roadways that cross or border the site, and would include new roadways to serve the proposed land use. Sections 3.4.1 and 3.4.2 include information regarding the roadway segment and intersection improvements that are considered part of the Jackson Township project.

3.1.2.2 Pedestrian and Bicycle Facilities

Figure 3.2 illustrates the proposed bikeway plan of the Jackson Township project. The roadways within the Jackson Township project would meet County standards, which would provide sidewalks and on- street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The Jackson Township project also provides several off-street (Class I) multi-purpose trails.

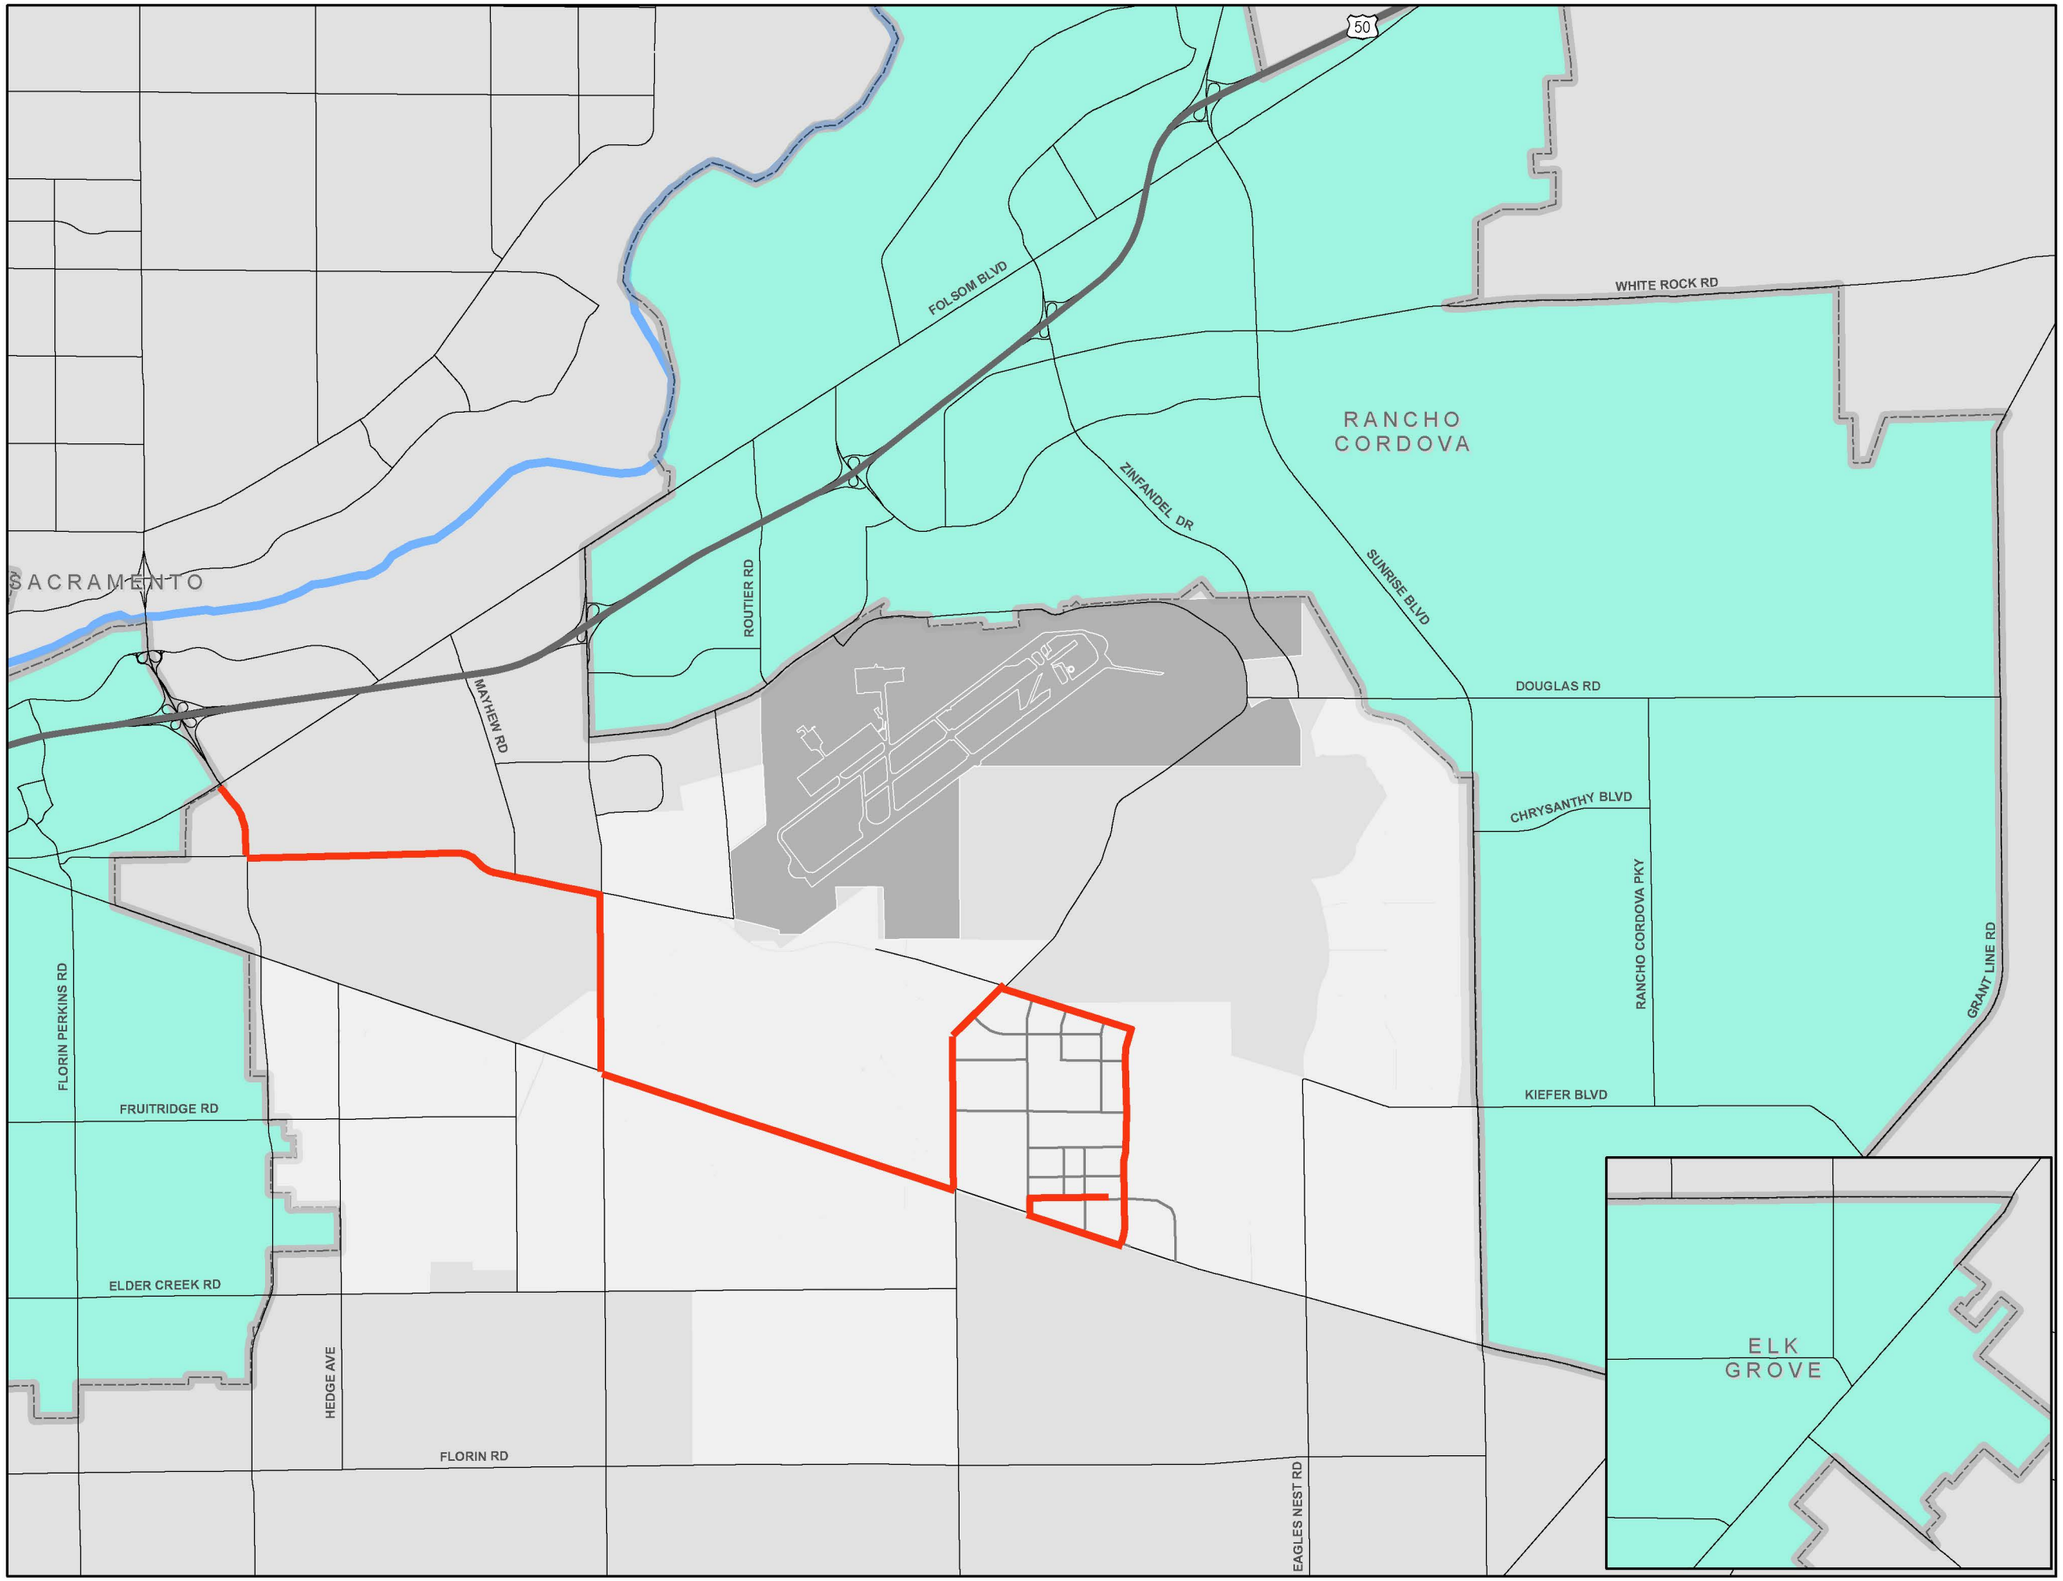
3.1.2.3 Transit System

Consistent with Sacramento County's General Plan policy LU-120, the Jackson Township project incorporates higher density land uses and mixed uses along transportation corridors to help support transit use. However, as described in Section 2.2, existing transit service is very limited near the Jackson Township project. The transit provider for the area, Sacramento Regional Transit (RT), has developed a long-range transit plan that anticipates three additional high frequency transit lines in the general area by the year 2035. However, even with this additional transit network, the Jackson Township project would likely not meet the County's General Plan policy.

To comply with the County's General Plan Policy LU-120, a separate planning effort involving staff from Sacramento County, RT, DKS, and the applicants of the FOUR PROJECTS was conducted to define an appropriate transit network and frequency that could serve the proposed development in the Jackson Corridor consistent with the intent of the County's policies.

An important consideration in the development of a transit network for the Jackson Corridor is that there are four major development projects proposed in the Jackson Corridor (FOUR PROJECTS) The transit planning effort needed to define standalone transit systems for each of the FOUR PROJECTS that would not only serve the transit needs of each of the FOUR PROJECTS independently, but would also serve as cohesive and complementary transit system units that could operate efficiently together should more than one of the FOUR PROJECTS be approved for development.

A series of transit networks and service frequencies were developed and tested using the SACSIM model with the objective of optimizing transit ridership and the number of boardings. Utilizing RT's performance criteria for evaluating the effectiveness of the various transit lines and service frequencies, an optimum transit network and frequency was developed for the Jackson Corridor.



The planning effort resulted in four transit lines that would serve the FOUR PROJECTS in the Jackson Corridor at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. **Figure 3.3** illustrates the proposed transit system for the Jackson Township project, which represents a portion of the ultimate transit system that would serve the FOUR PROJECTS. The combined transit system for the FOUR PROJECTS is discussed and illustrated in Section 4.1.2.3.

The proposed transit system for the Jackson Township project has been assumed as an attribute of the Jackson Township project and has been included in the traffic modeling for this traffic analysis. The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

3.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the Jackson Township project. **Table 3.2** summarizes the person trip generation. The Jackson Township project would generate over 15,000 daily work person trip ends, and over 112,000 daily person trip ends for all trip purposes.

Table 3.3 summarizes the estimated mode choice for the Existing plus Jackson Township project scenario. About 84.1 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 1.1 percent of all trips, while walk and bike modes will accommodate about 14.8 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 3.4 summarizes the vehicular (auto) trip generation of the Jackson Township project. The Jackson Township project is estimated to generate about 71,000 daily vehicle trip ends. It should be noted that more than one person trip may be accommodated by a vehicle trip (e.g. carpooling). Over 20,000 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the Jackson Township project, over 28 percent of the trip ends. The internal trip ends represent about 10,200 daily vehicle trips (one-half the number of internal trip ends). The Jackson Township project will generate over 50,000 external vehicle trips that have an origin or destination inside the Jackson Township project but the other end of the trip is outside the Jackson Township project. Table 3.4 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

3.3 TRIP DISTRIBUTION

The distribution of trips associated with development on the Jackson Township project site was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the Jackson Township project site. Trip distribution varies by land use and time period. **Figure 3.4** illustrates the overall trip distribution of daily Jackson Township project trips with the Existing Plus Jackson Township project scenario. The highest percentages of Jackson Township project traffic are accommodated on Jackson Road and Excelsior Road.

3.4 OPERATIONS ANALYSIS AND IMPACTS

For purposes of this analysis, full development of the Jackson Township project is assumed to occur "instantaneously." In this manner, the traffic and impacts associated with the Jackson Township project can be directly compared to known and measured conditions. Existing scenario impacts are determined by comparing the traffic operating conditions associated with the Jackson Township project with the traffic operating conditions associated with the existing (without development) conditions, and comparing the change to the thresholds of significance. **Figure 3.5** illustrates the resultant traffic operating conditions.

Table 3.2: Estimated Daily Person Trip Generation (Existing Plus Project Scenario) Jackson Township (Alternative 2) Specific Plan

Trip Purpose	Daily Person Trip Ends
Work Trips	15,508
Non-Work Trips	99,693
All Trip Purposes	112,200

Source: *DKS Associates, 2018.*

Table 3.3: Mode Split (Existing Plus Project Scenario) Jackson Township (Alternative 2) Specific Plan

Mode	Percentage of Person Trips by Trip Purpose		
	Work Trips	Non-Work Trips	All Trip Purposes
Auto - SOV	84.7%	43.2%	48.9%
Auto - HOV	908%	39.3%	35.2%
Transit	2.2%	1.0%	1.1%
Walk	2.9%	15.7%	14.0%
Bike	0.3%	0.9%	0.8%

3.4.1 Existing Plus Jackson Township Project Roadway Segment Impacts

Table 3.5 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the Jackson Township project, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways and widened roadways that are assumed part of the Jackson Township project. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the Jackson Township project, which would be greater than the number of lanes in the existing condition. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

3.4.2 Existing Plus Jackson Township Project Intersection Impacts

Tables 3.6 and 3.7 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the Jackson Township project. Table 3.7 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type were assumed to be implemented by the Jackson Township project. Shaded table cells in Table 3.6 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of changes to many of the intersections that are internal to or on the boundary of the Jackson Township project, which would be an improvement over the existing condition. The timing of implementation of such intersection improvements on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Happy Lane and Old Placerville Road
- Excelsior Road and Elder Creek Road
- Excelsior Road and Florin Road
- Mather Boulevard and Douglas Road

- Eagles Nest Road and Jackson Road
- Excelsior Road and Calvine Road

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

3.4.3 Existing Plus Jackson Township Project U.S. 50 Freeway Impacts

3.4.3.1 Freeway Basic Segments

Table 3.8 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. No locations exhibit significant impacts, based on Caltrans' threshold of significance (5% V/C increase).

3.4.3.2 Freeway Merge / Diverge / Weave Segments

Table 3.9 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Westbound
    - Watt Avenue to Howe Avenue weave - p.m. peak hour

3.4.3.3 Freeway Ramp Intersection Queuing

Table 3.10 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. No locations exhibit a significant impact.

3.4.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts

The Jackson Township project would not remove any existing or planned pedestrian facility. The Jackson Township project would not remove any existing bicycle facility, but would modify facilities that are planned in the Bikeway Master Plan. The Jackson Township project would add pedestrian and bicycle demands within the Jackson Township project site and to and from nearby land uses. As illustrated in Figure 3.2, the Jackson Township project has proposed changes to the Bikeway Master Plan. Because the Jackson Township project would add demand for pedestrian and bicycle facilities that may not be available in the site vicinity, the impact of the Jackson Township project on pedestrian and bicycle circulation is potentially significant.

3.4.5 Existing Plus Jackson Township Project Transit System Impacts

Public transit is not currently provided to the Jackson Township project site. In the preparation of this analysis, a conceptual transit system to serve the Jackson Township project and adjacent future projects was developed (see Section 3.1.2.3). The additional transit service was assumed to be funded by the Jackson Township project. However, the timing and implementation of the transit system are uncertain at this time. The Jackson Township project would increase demands for public transit facilities. Therefore, the impact of the Jackson Township project on the transit system is potentially significant.

3.4.6 Existing Plus Jackson Township Functionality Impacts

Table 3.11 summarizes the results of the rural roadway segment functionality analysis. **Figure 3.6** illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the Jackson Township project, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the Jackson Township project. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the project makes improvements to a roadway segment such as widening, it would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the Jackson Township project, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

Table 3.11

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

3.5 MITIGATION

3.5.1 Existing Plus Jackson Township Project Roadway Segment Mitigation

Table 3.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the Jackson Township project to implement. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

3.5.2 Existing Plus Jackson Township Project Intersection Mitigation

Tables 3.13 and 3.14 summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. Shaded table cells in Table 3.14 indicate those locations where changes in traffic control and / or number of approach lanes by type have been made which would be the responsibility of the Jackson Township project to implement. As shown in Table 3.13, all LOS impacts have been fully mitigated. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column in Table 3.14 shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

3.5.3 Existing Plus Jackson Township Project U.S. 50 Freeway Mitigation

Capacity improvements such as widening of the freeway and freeway junctions would reduce the severity of the impacts, but were generally not considered feasible due to right-of-way

restrictions, legal constraints, and the numerous transportation structures that would need to be modified and/or replaced. Potential alternative improvements have been identified from Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP). The TCR and CSMP is focused on intelligent transportation systems (ITS) and integrated corridor management (ICM) projects that would have operational benefits to US-50 without adding additional capacity. The TCR and CSMP also identify potential improvements to parallel local facilities that would be expected to reduce travel demand on US-50. The Jackson Township project will participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

3.5.3.1 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 weave between Watt Avenue and Howe Avenue, the project may pay a fair share toward the construction of:

- Bus/HOV lanes from Watt Avenue to Downtown Sacramento (2035 SACOG MTP)
- Replacement of existing communication lines with fiber optics to improve performance between SR-51/SR-99 and Watt Avenue (2013 10-Year SHOPP Plan)
- Auxiliary lane between the NB Howe Avenue on-ramp and the SB Howe Avenue on-ramp (2035 SACOG MTP)
- Ramp meter improvements (Caltrans ITS/OPS Project List)

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes that the project is responsible to provide.

3.5.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation

The Jackson Township project applicant shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the Jackson Township project and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the Jackson Township project vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

3.5.5 Existing Plus Jackson Township Project Transit System Mitigation

The Jackson Township project applicant shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 3.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

3.5.6 Existing Plus Jackson Township Project Functionality Mitigation

Table 3.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

3.5.7 Existing Plus Jackson Township Project Mitigation Summary

Tables 3.16 through 3.19 summarize all of the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts along with the mitigation success for these impacts.

Table 3.15

4. EXISTING PLUS FOUR PROJECTS SCENARIO (JACKSON TOWNSHIP PROJECT ALTERNATIVE 2)

4.1 PROJECT DESCRIPTION

The existing plus FOUR PROJECTS scenario evaluates the effects of the traffic of four developments (FOUR PROJECTS) added to existing conditions. **Figure 4.1** illustrates the location of the FOUR PROJECTS:

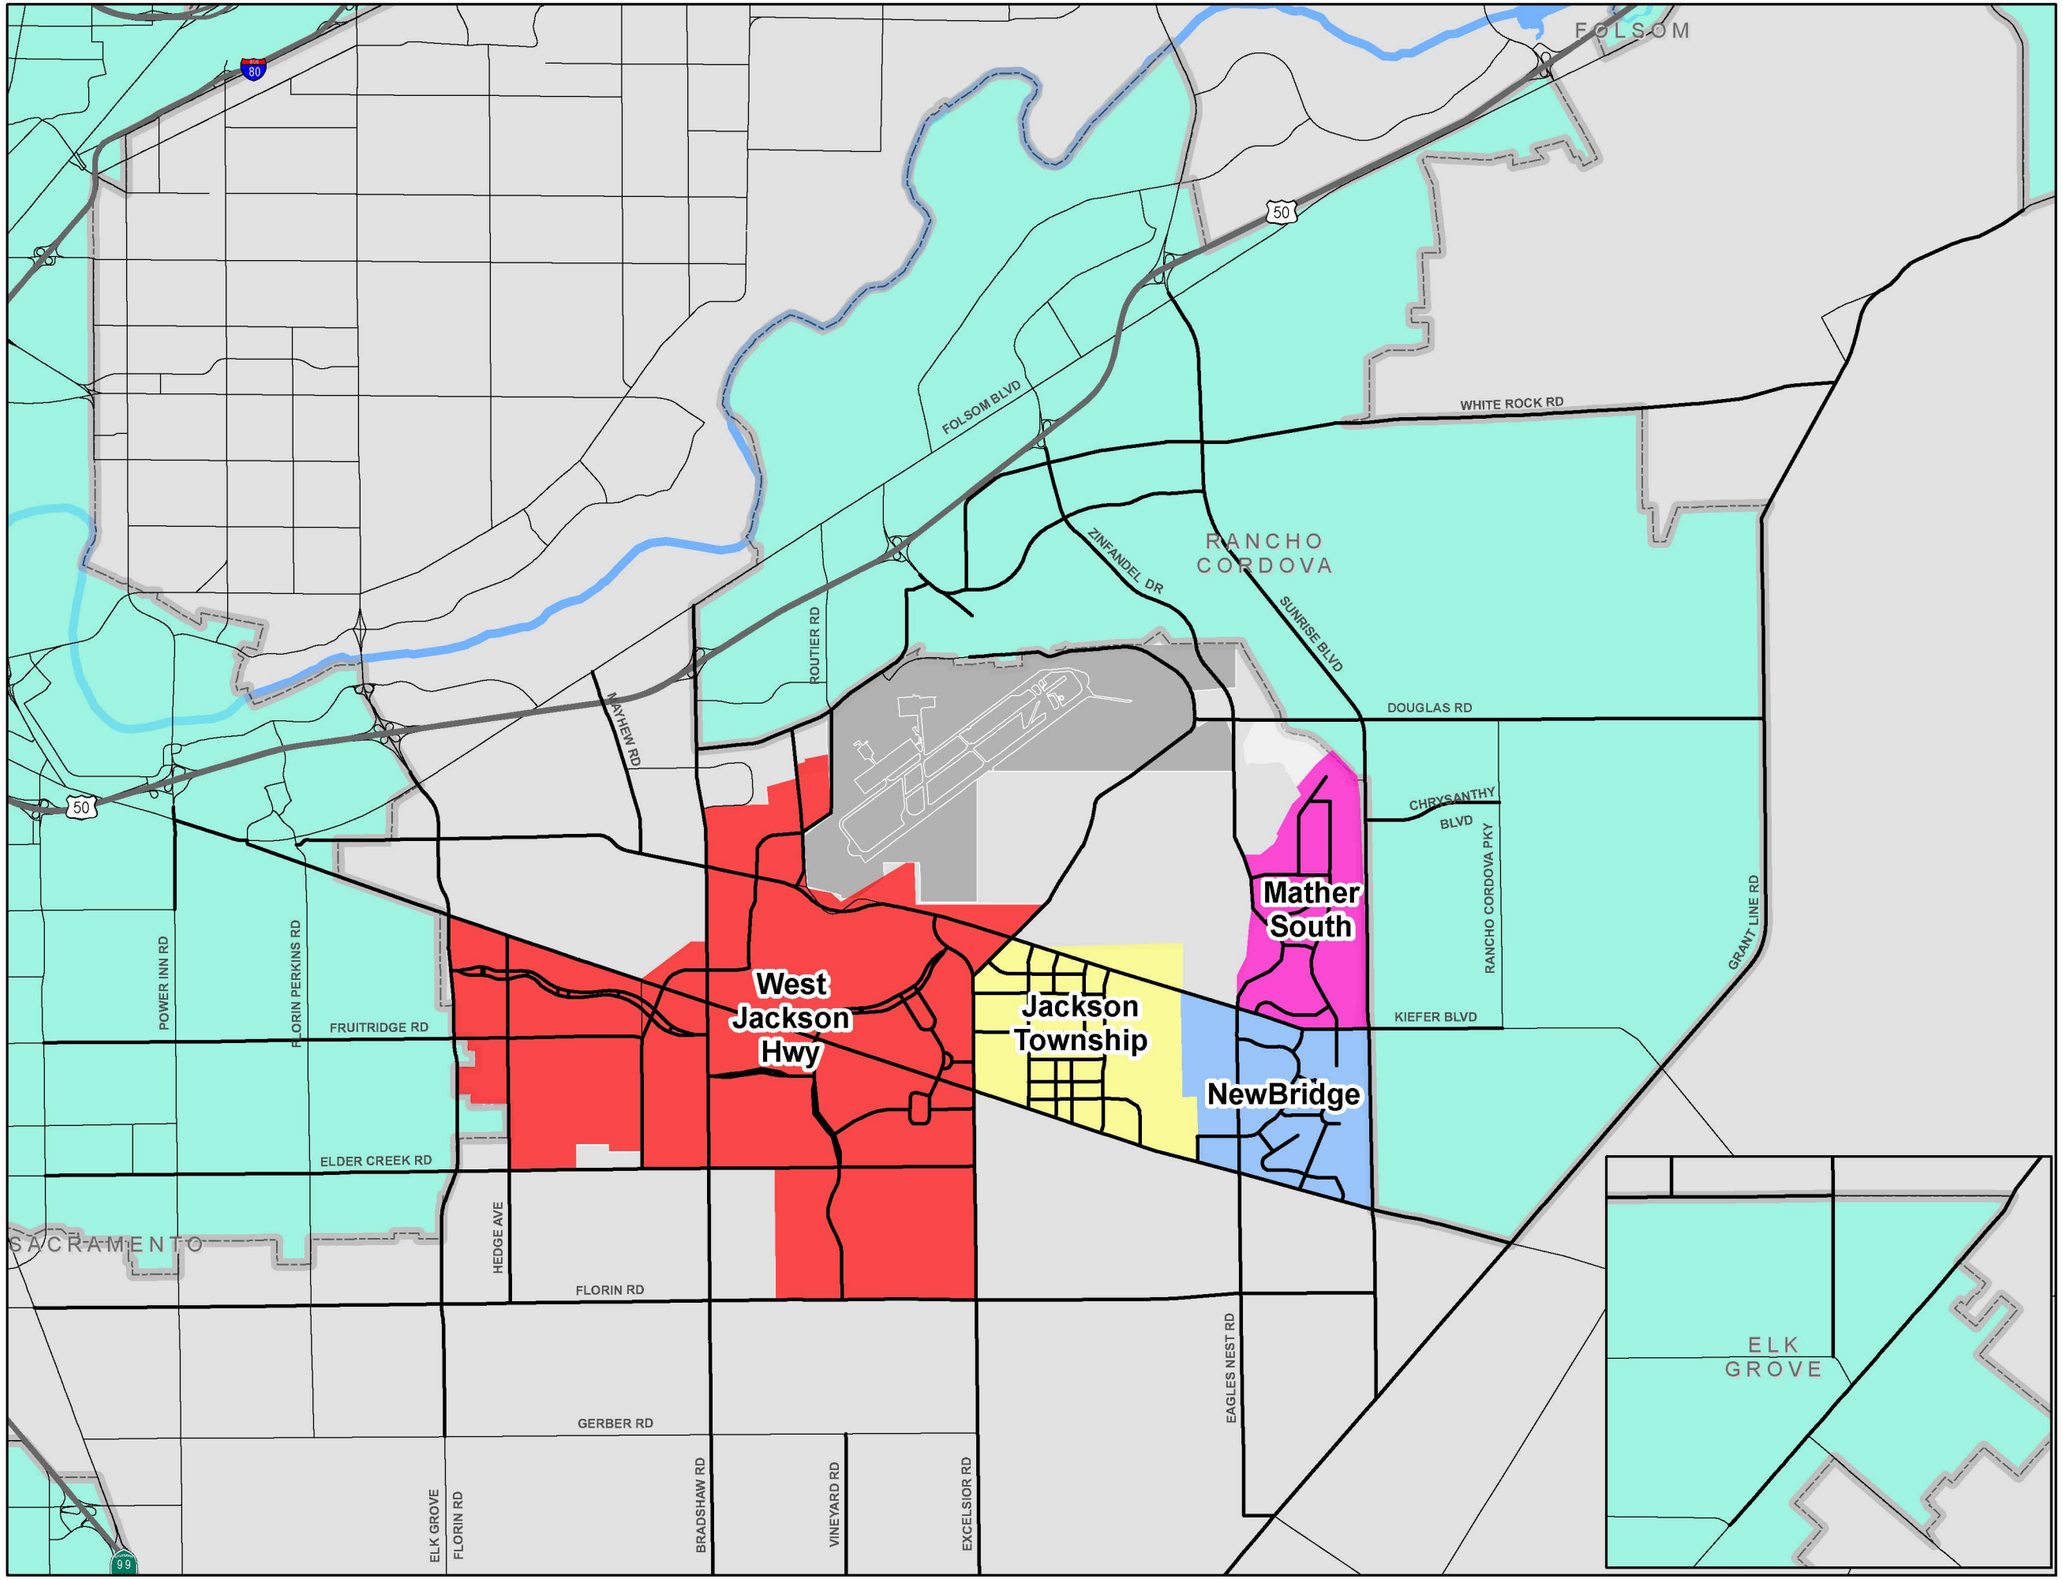
- West Jackson
- Jackson Township
- NewBridge
- Mather South

The FOUR PROJECTS are located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the community of Rosemont and the City of Rancho Cordova. The FOUR PROJECTS are located both north and south of Jackson Road (SR 16). The FOUR PROJECTS are generally bounded to the west by South Watt Avenue, to the north by the Community of Rosemont and Mather Airport, to the east by Sunrise Boulevard, and to the south by Elder Creek Road and Florin Road.

4.1.1 Land Use

Table 4.1 summarizes the land use assumptions for the FOUR PROJECTS in Jackson Corridor. Together, the FOUR PROJECTS would contain over 28,600 dwelling units and contain enough non-residential land uses to employ over 38,200 workers.

4.1.2 Transportation Network



4.1.2.1 Roadway Segments and Intersections

Figure 4.2 illustrates the FOUR PROJECTS transportation network. The FOUR PROJECTS would widen and / or complete many roadways that cross or border the FOUR PROJECTS sites. The FOUR PROJECTS would improve many intersections within or on the borders of the projects. In addition, the FOUR PROJECTS would include new roadways to serve the proposed land use. The proposed improvements associated with the FOUR PROJECTS are summarized later in Sections 4.2.1 and 4.2.2.

4.1.2.2 Pedestrian and Bicycle Facilities

The roadways within the FOUR PROJECTS would meet County standards, which would provide sidewalks and on-street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The FOUR PROJECTS also provide several off-street (Class I) multi-purpose trails.

4.1.2.3 Transit System

As described in Section 2.2, transit service in the vicinity of the FOUR PROJECTS is very limited. The FOUR PROJECTS are designed with significant amounts of higher density and mixed uses to help support transit use but transit service within walking distances of those uses is required to achieve significant transit ridership.

An accurate estimation of transit use requires the definition of specific transit routes and frequency of service on those routes. A separate planning effort, involving staff from Sacramento County and Sacramento Regional Transit (RT), was conducted to define an appropriate transit system for the transportation analysis. That effort is described in Section 3.1.2.3.

The planning effort resulted in four transit lines that would serve the FOUR PROJECTS at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. Another key characteristic of the proposed transit system built into the modeling assumptions is the targeted use of queue jumps on portions of key corridors (Bradshaw Road from Kiefer Boulevard to Rock Creek Parkway, and Jackson Road from Watt Avenue to Excelsior Road). Queue jumps ensure that buses are not excessively delayed at signals along congested corridors, and therefore not too heavily penalized from a travel time perspective. This is necessary to achieve the adequate ridership levels that were forecast and ensure reliable operations. **Figure 4.3** shows the assumed transit routes for this scenario.

The assumed transit routes, service frequency, and supporting infrastructure (i.e. queue jumps) would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

4.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the FOUR PROJECTS. **Table 4.2** summarizes the person trip generation. The FOUR PROJECTS would generate over 85,000 daily work person trip ends, and over 672,000 daily person trip ends for all trip purposes.

Table 4.3 summarizes the estimated mode choice for the Existing plus FOUR PROJECTS scenario. Over 90 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 1.4 percent of all trips, while walk and bike modes will accommodate about 7.7 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 4.4 summarizes the vehicular (auto) trip generation of the FOUR PROJECTS. The FOUR PROJECTS are estimated to generate nearly 462,000 daily vehicle trip ends. About 100,700 of the daily vehicle trip ends will be associated with trips with both an origin and destination within

the individual projects, about 21.8 percent of the trip ends. The internal trip ends represent about 50,300 daily vehicle trips (one-half the number of internal trip ends). The FOUR PROJECTS will generate about 361,200 external vehicle trips that have an origin or destination inside one of the FOUR PROJECTS but the other end of the trip is outside the project from which it originated. Table 4.4 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

Table 4.2: Estimated Daily Person Trip Generation (Existing Plus FOUR PROJECTS Alt. 2 Scenario)

Trip Purpose	Daily Person Trip Ends
Work Trips	85,601
Non-Work Trips	587,097
All Trip Purposes	672,698

Table 4.4: Estimated Daily Vehicle Trip Generation (Existing Plus FOUR PROJECTS Alt. 2 Scenario)

Trip Type		AM Peak Hour	PM Peak Hour	Daily
Total Vehicle Trip Ends		39,960	43,388	461,920
Percent Internal Trip Ends[1]		18.5%	22.3%	21.8%
Vehicle Trips	Internal to Projects	3,687	4,838	50,315
	External to Projects	32,585	33,712	361,290
	Total	36,273	38,550	411,605

[1.] Both trip ends within individual projects.

Source: *DKS Associates, 2018.*

4.3 TRIP DISTRIBUTION

The distribution of trips associated with development of the FOUR PROJECTS was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the FOUR PROJECTS. Trip distribution varies by land use and time period. **Figure 4.4** illustrates the overall trip distribution of daily FOUR PROJECTS trips with the Existing Plus FOUR PROJECTS scenario. The highest percentages of FOUR PROJECTS traffic are accommodated on Jackson Road, Bradshaw Road, Kiefer Boulevard, and Vineyard Road.

4.4 OPERATIONS ANALYSIS AND IMPACTS

For purposes of this analysis, full development of the FOUR PROJECTS is assumed to occur "instantaneously." In this manner, the traffic and impacts associated with the FOUR PROJECTS can be directly compared to known and measured conditions. Existing scenario impacts are determined by comparing the traffic operating conditions associated with the FOUR PROJECTS with the traffic operating conditions associated with the existing (without FOUR PROJECTS) conditions, and comparing the change to the thresholds of significance. **Figure 4.5** illustrates the resultant traffic operating conditions.

4.4.1 Existing Plus FOUR PROJECTS Roadway Segment Impacts

Table 4.5 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

Table 4.5
Existing Plus FOUR PROJECTS Roadway Segment Levels of Service

ID	Roadway	Segment		Existing					Existing + FOUR PROJECTS					Project(s) Responsible for Change in Lanes
		From	To	Travel Lanes	Facility Type[1]	Daily Volume	Volume / Capacity Ratio	Level of Service	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

4.4.2 Existing Plus FOUR PROJECTS Intersection Impacts

Tables 4.6 and 4.7 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 4.7 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 4.6 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Hedge Avenue and Florin Road
- Happy Lane and Old Placerville Road
- Excelsior Road and Gerber Road
- Eagles Nest Road and Florin Road
- Excelsior Road and Calvine Road

4.4.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Impacts

4.4.3.1 Freeway Basic Segments

Table 4.8 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound US 50
    - Stockton Boulevard to 59th Street - a.m. peak hour
    - Zinfandel Drive to Hazel Avenue - p.m. peak hour
- Westbound US 50
    - Watt Avenue to SR 99 / SR 51 - p.m. peak hour

4.4.3.2 Freeway Merge/Diverge/Weave Segments

Table 4.9 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound
    - 65th Street to Howe Avenue weave - a.m. peak hour
    - Mather Field Road to Zinfandel Drive weave - a.m. peak hour

4.4.3.3 Freeway Ramp Intersection Queuing

Table 4.10 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. No locations exhibit a significant impact.

4.4.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts

The FOUR PROJECTS would not remove any existing or planned pedestrian facility. The FOUR PROJECTS would not remove any existing bicycle facility or any facility that is planned in the Bikeway Master Plan. The FOUR PROJECTS would add pedestrian and bicycle demands within the FOUR PROJECTS site and to and from nearby land uses. Complete information on improvements to on- and off-site bicycle and pedestrian facilities is not available at this time. Because the FOUR PROJECTS would add demand for pedestrian and bicycle facilities that may not be available, the impact of the FOUR PROJECTS on pedestrian and bicycle circulation is potentially significant.

4.4.5 Existing Plus FOUR PROJECTS Transit System Impacts

Public transit service is currently limited in the vicinity of the FOUR PROJECTS. In the preparation of this analysis, a conceptual transit system to serve the FOUR PROJECTS was developed (see Section 3.1.2.3). The additional transit service was assumed to be funded by the FOUR PROJECTS. However, the timing and implementation of the transit system are uncertain at this time. The FOUR PROJECTS would increase demands for public transit facilities. Therefore, the impact of the FOUR PROJECTS on the transit system is potentially significant.

4.4.6 Existing Plus FOUR PROJECTS Functionality Impacts

Table 4.11 summarizes the results of the rural roadway segment functionality analysis. **Figure 4.6** illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

4.5 MITIGATION

4.5.1 Existing Plus FOUR PROJECTS Roadway Segment Mitigation

Table 4.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund and provide. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

4.5.2 Existing Plus FOUR PROJECTS Intersection Mitigation

Tables 4.13 and 4.14 summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. Shaded table cells in Table 4.14 indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund and provide. The Jackson Township project would contribute a fair share. The shaded table cells in Table 4.13 under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 4.14 also identifies those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Three intersections are currently designated as "High Capacity Intersections" on the County's General Plan: Watt Avenue & Folsom Boulevard, Watt Avenue & Kiefer Boulevard, and Watt Avenue & Jackson Road.

A high capacity intersection would utilize special treatments to increase the capacity of the intersection so as to reduce congestion and travel delay. Since each intersection could have unique travel movements, volumes and existing context sensitive conditions, the special treatments utilized at each high capacity intersection will be selected to meet the specific needs of each intersection. The range of special treatments is quite wide, ranging from the restriction of certain turning movements to various combinations that could include grade separating certain movements. While the field of traffic engineering is ever expending and evolving resulting in the use of new technologies and treatments, special treatments such as the following could be utilized at a high capacity intersection:

- Restricting turning movements
- Median U-turns
- Roundabouts
- Split intersections
- Quadrant roadway intersections
- Bowtie intersections
- Directional flyovers
- Center turn overpass
- Grade separated Roundabout
- Diverging diamond grade separation
- Compact diamond grade separation
- Single point urban grade separation
- Traditional urban grade separation

The County has conducted conceptual engineering to define potential improvements at the three study area intersections on Watt Avenue that are currently designated as "High Capacity Intersections" on the County's General Plan. These are:

- At the **Watt Avenue & Folsom Boulevard** intersection, the County proposes an ultimate configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off-ramps from the left lanes of Watt Avenue to a single signalized intersection. A bus rapid transit (BRT) lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal. This design is consistent with the recommendations of the South Watt Area Transportation Study (SWATS) dated November 1, 2002 and approved by the Board of Supervisors on November 26, 2002, and with the planning study for the *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of

Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Kiefer Boulevard** intersection, the County proposes a tight diamond interchange as the ultimate improvement. The through movements (and BRT lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard. This design is proposed in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Jackson Road** intersection, the County proposes a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications. 1) The southbound left-turn movement would be grade separated; 2) The westbound right-turn movement would be grade separated; and 3) Three northbound left-turn lanes are proposed. This configuration represents an enhanced version of Alternative 6 in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr and Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

4.5.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Mitigation

According to Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP), all mainline freeway lanes of the 8-lane ultimate facility (4 lanes in each direction) have already been built, with the exception of the segment between Zinfandel Drive and Sunrise Boulevard (where 6 of the 8 ultimate lanes exist today). With the exception of this segment, capacity improvements to widen the freeway mainline are precluded by the ultimate configuration in the TCR/CSMP. The TCR/CSMP does conceptualize other projects that will benefit the US-50 corridor without adding additional mainline travel lanes. These improvements generally fall into one of three categories:

- Intelligent transportation systems (ITS) and integrated corridor management (ICM) projects. Some examples may include ramp metering and multimodal improvements.
- Improvements to parallel local facilities. Such projects are expected to reduce travel demand on US-50.
- Future HOV lanes and auxiliary lanes. These projects would extend, or bridge gaps in, the existing HOV and auxiliary lane network. Constructing these lanes is permissible even when further widening of the mainline is not allowable, and is consistent with the ultimate configuration in the TCR/CSMP.

The FOUR PROJECTS shall participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

4.5.3.1 US-50 Eastbound Alternative Improvements

To lessen the impact to the eastbound US-50 mainline between Stockton Boulevard and 59th Street, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)

To lessen the impact to the eastbound US-50 weave between 65th Street and Howe Avenue, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)
- Widen 65th Street to 5 lanes from US-50 to Broadway (2035 SACOG MTP)

To lessen the impact to the eastbound US-50 weave between Mather Field Road and Zinfandel Drive, the project may pay a fair share toward the construction of:

- An interchange modification of US-50 at Mather Field Road (2035 SACOG MTP)

To lessen the impact to the eastbound US-50 mainline between Zinfandel Drive and Hazel Avenue, the project may pay a fair share toward the construction of:

- Auxiliary lanes between Zinfandel Drive and Sunrise Boulevard (2035 SACOG MTP)
- Auxiliary lanes between Sunrise Boulevard and Hazel Avenue (2035 SACOG MTP)
- Widen Sunrise Boulevard to 6 lanes with special treatments, including intersection improvements at White Rock Road, Folsom Boulevard, Coloma Road, Gold Express Drive, and Gold Country Boulevard (2035 SACOG MTP)
- A new interchange at Rancho Cordova Parkway, including a 4-lane arterial from US-50 to White Rock Road (2035 SACOG MTP)

- Multi-modal corridor improvements and interchange improvements at Hazel Avenue (2035 SACOG MTP)

4.5.3.2 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 mainline between Watt Avenue and SR-51/SR-99, the project may pay a fair share toward the construction of:

- Bus/HOV lanes from Watt Avenue to Downtown Sacramento (2035 SACOG MTP)
- Replacement of existing communication lines with fiber optics to improve performance between SR-51/SR-99 and Watt Avenue (2013 10-Year SHOPP Plan)
- Auxiliary lane between the NB Howe Avenue on-ramp and the SB Howe Avenue on-ramp (2035 SACOG MTP)
- Ramp meter improvements (Caltrans ITS/OPS Project List)

4.5.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation

The FOUR PROJECTS applicants shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the FOUR PROJECTS and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the FOUR PROJECTS vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

4.5.5 Existing Plus FOUR PROJECTS Transit System Mitigation

The applicants of the FOUR PROJECTS shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 3.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

4.5.6 Existing Plus FOUR PROJECTS Functionality Mitigation

Table 4.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

4.5.7 Existing Plus FOUR PROJECTS Mitigation Summary

Tables 4.16 through 4.21 summarize all of the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts along with the mitigation success for these impacts.

Table 4.15
Existing Plus FOUR PROJECTS Functionality Mitigations

78	Kiefer Blvd	Zinfandel Dr	Sunrise Blvd	3	No	14,640	Yes[3]	Widen to County standards [5]	No

Red text with light gray shading indicate project impacts.

Table 4.15
Existing Plus FOUR PROJECTS Functionality Mitigations

ID	Roadway	Segment		Existing + FOUR PROJECTS				Mitigation	Impact after Mitigation?
		From	To	Travel Lanes	Substandard? [1]	Forecasted Volume	Functionality Impact? [2]		
89	Mayhew Rd	Jackson Rd	Fruitridge Rd	4	No	34,140	Yes[3]	Widen to County standards [5]	No
123	Zinfandel Dr	Douglas Rd	Kiefer Blvd	2	Yes	19,830	Yes	Widen to County standards [5]	No

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

5. MTP CUMULATIVE PLUS FOUR PROJECTS SCENARIO

5.1 FOUR PROJECTS DESCRIPTION

The MTP Cumulative plus FOUR PROJECTS scenario evaluates the effects of the traffic of four developments (the FOUR PROJECTS) added to MTP Cumulative conditions.

5.1.1 MTP Cumulative Land Use

Outside the FOUR PROJECTS, SACOG's 2035 development forecasts (the amount and location of housing and employment) for the adopted 2012 Metropolitan Transportation Plan (MTP) were used to prepare travel demand forecasts for this scenario.

Table 5.1 summarizes the MTP Cumulative Plus Four Project scenario land use.

Table 5.1: Assumed Land Use for MTP Cumulative Plus FOUR PROJECTS Scenario			
Project	**General Land Use**	**Acres**	**Dwelling Units**
West Jackson	Residential	1979.9	12,345
	Assumed Density Bonus[1]		237
	Mixed Use	120.9	2,418
	Commercial	342.8	
	Employment	803.3	
	Industrial	154.8	
	Schools	131.7	
	Park/Open Space/Ag	2108.3	
	Institutional	23.4	
	Primary Roadways	248.2	
	Subtotal	**5913.3**	**15,000**
Jackson Township	Residential	589.1	5,590
	Assumed Density Bonus[1]		76
	Commercial/Mixed Use	95.6	100
	Office	35.2	
	Pubic/Quasi Public	102.5	
	Park/Open Space/Ag	409.4	448
	Primary Roadways	84.2	
	Subtotal	**1,391.0**	**6,214**
New Bridge	Residential	368.0	2,915
	Assumed Density Bonus[1]		108
	Commercial/Mixed Use	31.7	160
	Office	13.8	
	Pubic/Quasi Public	13.8	
	Park/Open Space/Ag	514.7	660
	Primary Roadways	47.9	
	Subtotal	**1,095.3**	**3,843**

Project	General Land Use	Acres	Dwelling Units
Mather South	Residential	428.7	3,352
	Assumed Density Bonus[1]		30
	Commercial	21.1	
	Environmental Education Campus	27.9	200
	Research and Development	21.4	
	Parks & Recreation	43.1	
	Public Utilities	3.5	
	Schools	23.7	
	Open Space	210.5	
	Streets	62.7	
	Subtotal	**848.2**	**3,552**

[1] Reflects estimated potential for additional units that may occur due to County's Housing Incentive Program.

5.1.2 Transportation Network

Figure 5.1 illustrates the transportation network associated with the MTP Cumulative without FOUR PROJECTS scenario, consisting of the improvements in the adopted 2012 Metropolitan Transportation Plan (MTP).

Figure 5.2 shows the transportation network associated with the MTP Cumulative with FOUR PROJECTS scenario. The FOUR PROJECTS would widen and / or complete many roadways that cross or border the PROJECT site. The FOUR PROJECTS would include new roadways to serve the proposed land use.

5.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the FOUR PROJECTS. **Table 5.2** summarizes the person trip generation. The FOUR PROJECTS would generate over 84,500 daily work person trip ends, and over 688,000 daily person trip ends for all trip purposes.

Table 5.3 summarizes the estimated mode choice for the MTP plus FOUR PROJECTS scenario. Over 90 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 2.2 percent of all trips, while walk and bike modes will accommodate about 7.3 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 5.4 summarizes the vehicular (auto) trip generation of the FOUR PROJECTS. The FOUR PROJECTS are estimated to generate over 464,500 daily vehicle trip ends. Over 96,000 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the individual projects, representing over 20.5 percent of the trip ends. The internal trip ends represent over 48,000 daily vehicle trips (one-half the number of internal trip ends). The FOUR PROJECTS will generate over 363,500 external vehicle trips that have an origin or destination inside one of the FOUR PROJECTS but the other end of the trip is outside the project from which it originated. **Table 5.4** also shows the vehicle trips generated during the a.m. and p.m. peak hours.

Table 5.2: Estimated Daily Person Trip Generation (MTP Cumulative)

FOUR PROJECTS

Trip Purpose	Daily Person Trip Ends
Work Trips	84,574
Non-Work Trips	603,767
All Trip Purposes	688,341

Source: *DKS Associates, 2018.*

Table 5.3: Mode Split (MTP Cumulative)

FOUR PROJECTS

Mode	Percentage of Person Trips by Trip Purpose		
	Work Trips	Non-Work Trips	All Trip Purposes
Auto - SOV	82.8%	47.4%	51.7%
Auto - HOV	11.1%	42.7%	38.8%
Transit	4.8%	1.8%	2.2%
Walk	0.7%	7.2%	6.4%
Bike	0.6%	0.9%	0.9%

5.3 OPERATIONS ANALYSIS

This analysis compares the traffic operating conditions associated with the FOUR PROJECTS with the traffic operating conditions associated with the MTP Cumulative (without FOUR PROJECTS) conditions. While the MTP Cumulative scenario is not used for purposes of impact determination, this analysis notes where thresholds of significance are exceeded.

5.3.1 MTP Cumulative Plus FOUR PROJECTS Roadway Segments

Table 5.5 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS that has exceeded the threshold of significance.

Table 5.5

Table 5.5
MTP Cumulative Roadway Segment Levels of Service

ID	Roadway	Segment		MTP Cumulative No Project					MTP Cumulative + FOUR PROJECTS					Project(s) Responsible for Change in Lanes
		From	To	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

5.3.2 MTP Cumulative Plus FOUR PROJECTS Functionality Exceeding the Threshold

Table 5.6 summarizes the results of the rural roadway segment functionality analysis. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Exceed Functionality Threshold?" heading indicate those locations with a functionality that exceeds the threshold of significance.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not volumes would exceed the threshold of significance at some time prior to full build out of the FOUR PROJECTS.

Table 5.6
MTP Cumulative Plus FOUR PROJECTS Roadway Segment Functionality

ID	Roadway	Segment		Jurisdiction	Existing Substandard Roadways				MTP Cumulative + FOUR PROJECTS

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicates threshold exceeded.

5.4 MTP Cumulative Plus FOUR PROJECTS Mitigation Summary

Tables 5.7 and 5.8 summarize all roadway segments that would exceed the thresholds of significance for level of service and functionality.

6. CEQA CUMULATIVE PLUS FOUR PROJECTS SCENARIO (JACKSON TOWNSHIP ALTERNATIVE 2)

6.1 FOUR PROJECTS DESCRIPTION

The CEQA Cumulative plus FOUR PROJECTS scenario evaluates the effects of the traffic of four developments added to CEQA Cumulative conditions. Figure 4.1 illustrates the location of the FOUR PROJECTS:

- West Jackson Highway Master Plan (West Jackson)
- Jackson Township Specific Plan (Jackson Township)
- NewBridge Specific Plan (NewBridge)
- Mather South Specific Plan Amendment (Mather South)

6.1.1 CEQA Cumulative Land Use

Outside the FOUR PROJECTS area (see Figure 4.1), SACOG's 2035 development forecasts (the amount and location of housing and employment) for the adopted 2012 Metropolitan Transportation Plan (MTP) were used to prepare travel demand forecasts for this scenario. In addition, full build out of all reasonably foreseeable development projects was assumed within the study area, including the following major developments:

- Unincorporated Sacramento County
  - Vineyard Springs Comprehensive Plan
  - North Vineyard Station Specific Plan
  - Florin Vineyard Gap Community Plan
  - Mather Airport Specific Plan
  - Cordova Hills
  - Easton
  - Glenborough
  - East County Quarries

- City of Ranch Cordova

6.1.2 Transportation Network

Figure 6.1 illustrates the transportation network associated with the CEQA Cumulative without FOUR PROJECTS scenario. Outside the FOUR PROJECTS area (see Figure 4.1), it consists of the improvements through 2035 in the adopted 2012 Metropolitan Transportation Plan (MTP). Within the FOUR PROJECTS area, it includes roadway improvements beyond those in the MTP, which would be fully funded by the developments assumed in this scenario or by other committed funding sources. Sacramento County staff helped define such improvements and the number of roadway lanes for this scenario.

Figure 6.2 illustrates the transportation network associated with the CEQA Cumulative with FOUR PROJECTS scenario. The FOUR PROJECTS would construct new roadways within their sites, and widen many existing roadways within or on the borders of their sites. Details of this expansion of the roadway system is included in Section 6.2.1.

6.1.2.3 Pedestrian and Bicycle Facilities

The roadways within the FOUR PROJECTS would meet County standards, which would provide sidewalks and on-street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The FOUR PROJECTS also provide several off-street (Class I) multi-purpose trails.

6.1.2.4 Transit System

The FOUR PROJECTS are designed with significant amounts of higher density and mixed uses to help support transit use but transit service within walking distances of those uses is required to achieve a significant transit ridership. An accurate estimation of transit use requires the definition of specific transit routes and frequency of service on those routes. A separate planning effort, involving staff from Sacramento County and Sacramento Regional Transit (RT), was conducted to define an appropriate transit system for the transportation analysis. That effort is described in Section 3.1.2.3.

The planning effort resulted in four transit lines that would serve the FOUR PROJECTS at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. Another key characteristic of the proposed transit system built into the modeling assumptions is the targeted use of queue jumps on portions of key corridors (Bradshaw Road from Kiefer Boulevard to Rock Creek Parkway, and Jackson Road from Watt Avenue to Excelsior Road). Queue jumps ensure that buses are not excessively delayed at signals along congested corridors, and therefore not too heavily penalized from a travel time perspective. This is necessary to achieve the adequate ridership levels that were forecast and ensure reliable operations. **Figure 6.3** shows the assumed transit routes for this scenario.

The assumed transit routes, service frequency, and supporting infrastructure (i.e. queue jumps) would be required at full development of the FOUR PROJECTS. The full level of transit service

would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

6.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the FOUR PROJECTS. **Table 6.1** summarizes the person trip generation. The FOUR PROJECTS would generate over 86,000 daily work person trip ends, and over 730,000 daily person trip ends for all trip purposes.

Table 6.2 summarizes the estimated mode choice for the CEQA cumulative with FOUR PROJECTS scenario. Over 90 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 1.9 percent of all trips, while walk and bike modes will accommodate about 6.9 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 6.3 summarizes the vehicular (auto) trip generation of the FOUR PROJECTS. The FOUR PROJECTS are estimated to generate nearly 498,000 daily vehicle trip ends. Over 62,700 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the individual projects, about 12.6 percent of the trip ends. The internal trip ends represent over 31,000 daily vehicle trips (one-half the number of internal trip ends). The FOUR PROJECTS will generate about 435,000 external vehicle trips that have an origin or destination inside one of the FOUR PROJECTS but the other end of the trip is outside the project from which it originated. Table 6.3 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

6.3 TRIP DISTRIBUTION

The distribution of trips associated with development of the FOUR PROJECTS was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the FOUR PROJECTS. Trip distribution varies by land use and time period. **Figure 6.4** illustrates the overall trip distribution of daily FOUR PROJECTS trips with the CEQA Plus FOUR PROJECTS scenario. The highest percentages of FOUR PROJECTS traffic are accommodated on Jackson Road, Bradshaw Road, Kiefer Boulevard, and Vineyard Road.

Table 6.1: Estimated Daily Person Trip Generation
(CEQA Cumulative Plus FOUR PROJECTS Alternative 2 Scenario)

Trip Purpose	Daily Person Trip Ends
Work Trips	86,484
Non-Work Trips	643,573
All Trip Purposes	730,057

6.4 OPERATIONS ANALYSIS AND IMPACTS

Cumulative scenario impacts are determined by comparing the traffic operating conditions associated with the FOUR PROJECTS with the traffic operating conditions associated with the cumulative (without FOUR PROJECTS) conditions, and comparing the change to the thresholds of significance. **Figure 6.5** illustrates the resultant traffic operating conditions associated with the CEQA Cumulative (without FOUR PROJECTS) scenario. **Figure 6.6** illustrates the resultant traffic operating conditions associated with the CEQA Cumulative Plus FOUR PROJECTS scenario.

6.4.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Impacts

Table 6.4 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

6.4.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Impacts

Table 6.5 and 6.6 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 6.6 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 6.5 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Happy Lane and Old Placerville Road
- Eagles Nest Road and Florin Road

6.4.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Impacts

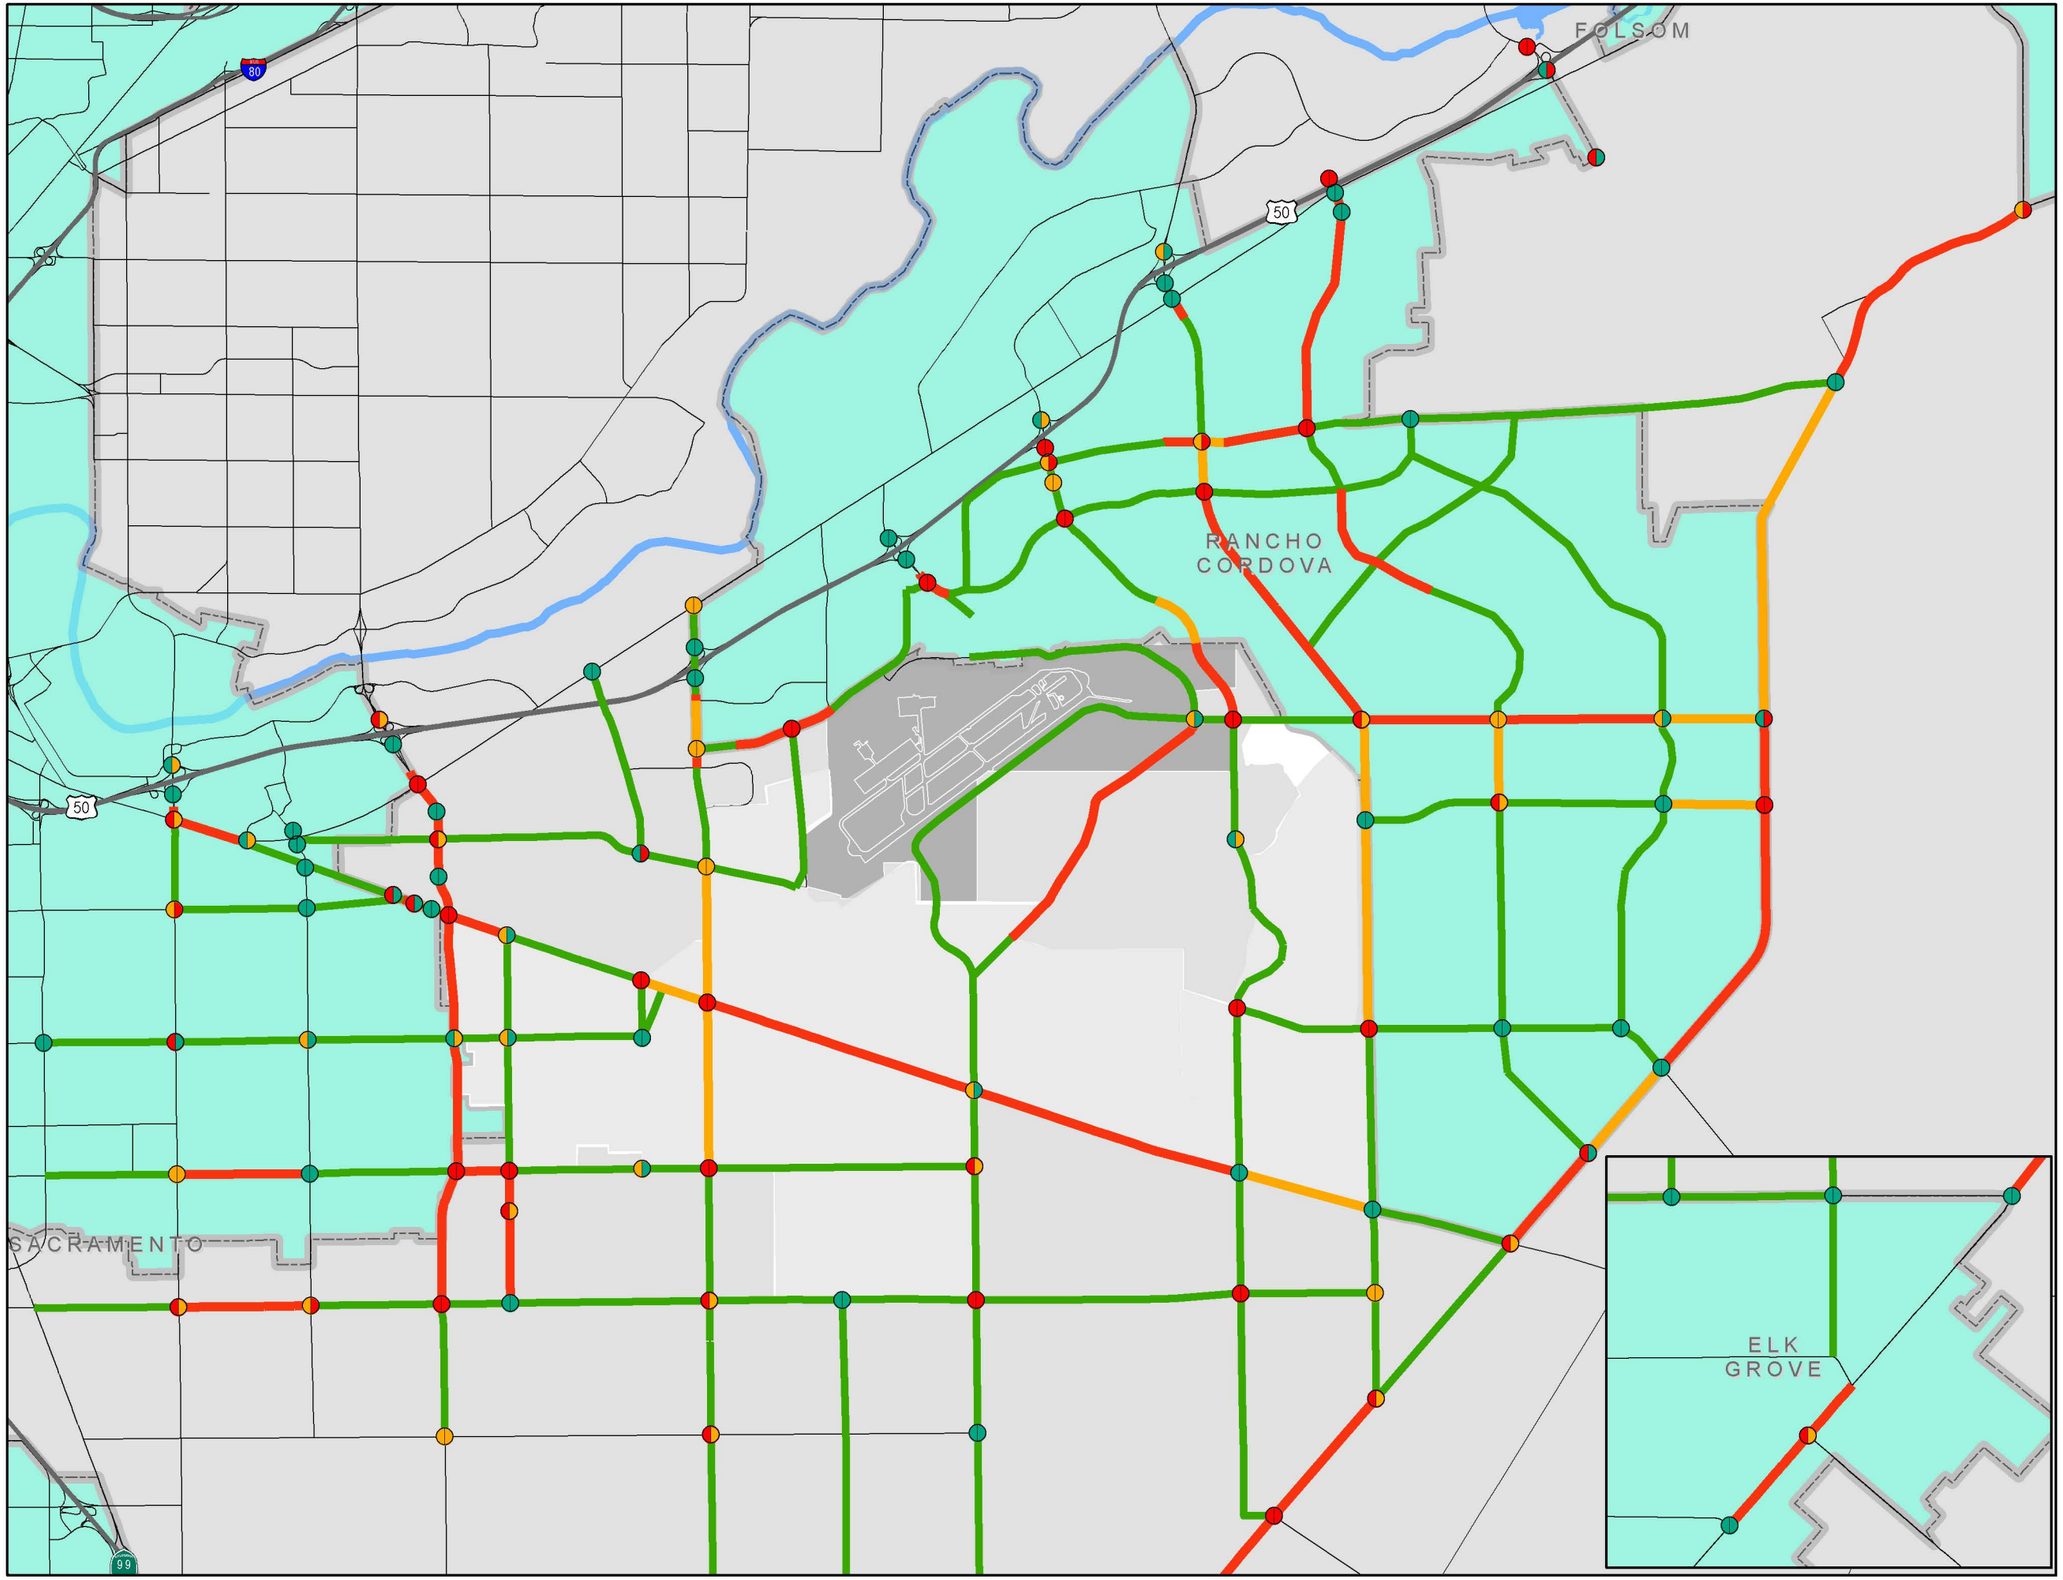
6.4.3.1 Freeway Basic Segments

Table 6.7 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound
    - Stockton Boulevard to 59th Street - a.m. peak hour

6.4.3.2 Freeway Merge/Diverge/Weave Segments

Table 6.8 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:



- Westbound
    - Hazel Avenue to Rancho Cordova Parkway weave - a.m. peak hour

6.4.3.3 Freeway Ramp Intersection Queuing

Tables 6.9 and 6.10 summarize a.m. and p.m. peak hour freeway ramp intersection queuing. The following locations exhibit a significant impact:

- Eastbound
    - Exit ramp to Howe Avenue - right turn queue length exceeds available storage – a.m. peak hour
    - Exit ramp to Zinfandel Drive-right turn and through queue length exceeds available storage – a.m. peak hour
- Westbound
    - Exit ramp to Rancho Cordova Parkway - left turn queue length exceeds available storage – a.m. and p.m. peak hours

		From	To	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

6.4.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts

The FOUR PROJECTS would not remove any existing or planned pedestrian facility that is planned in the Bikeway Master Plan. The FOUR PROJECTS would add pedestrian and bicycle demands within the FOUR PROJECTS site and to and from nearby land uses. Specific information on improvements to on- and off-site bicycle and pedestrian facilities is not available at this time. Because the FOUR PROJECTS would add demand for pedestrian and bicycle facilities that may not be available, the impact of the FOUR PROJECTS on pedestrian and bicycle circulation is potentially significant.

6.4.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Impacts

Public transit would not be provided to the sites of the FOUR PROJECTS under CEQA Cumulative scenario without development of the FOUR PROJECTS. In the preparation of this analysis, a transit system to serve the FOUR PROJECTS was developed (see Section 3.1.2.3). However, the timing and implementation of the transit system are uncertain at this time. The FOUR PROJECTS would increase demands for public transit facilities. Therefore, the impact of the FOUR PROJECTS on the transit system is potentially significant.

6.4.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts

Table 6.11 summarizes the results of the rural roadway segment functionality analysis. **Figure 6.7** illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

		From	To		Travel Lanes	Pavement (ft)	Substandard? [1]	Existing Volume	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

6.5 MITIGATION

6.5.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Mitigation

Table 6.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

6.5.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Mitigation

Tables 6.13a and 6.14a summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. **Tables 6.13b and 6.14b** summarize the results of the operations analysis for the study area intersections with the ultimate mitigation, which may exceed the County's standard number of approach lanes. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 6.14a and Table 6.14b also identify those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These

alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Three intersections are currently designated as "High Capacity Intersections" on the County's General Plan: Watt Avenue & Folsom Boulevard, Watt Avenue & Kiefer Boulevard, and Watt Avenue & Jackson Road. At two intersections on Bradshaw Road where an LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures by designating those two intersections as High Capacity Intersections: Bradshaw Road & Mayhew Road and Bradshaw Road & Jackson Road.

A high capacity intersection would utilize special treatments to increase the capacity of the intersection so as to reduce congestion and travel delay. Since each intersection could have unique travel movements, volumes and existing context sensitive conditions, the special treatments utilized at each high capacity intersection will be selected to meet the specific needs of each intersection. The range of special treatments is quite wide, ranging from the restriction of certain turning movements to various combinations that could include grade separating certain movements. While the field of traffic engineering is ever expending and evolving resulting in the use of new technologies and treatments, special treatments such as the following could be utilized at a high capacity intersection:

- Restricting turning movements
- Median U-turns
- Roundabouts
- Split intersections
- Quadrant roadway intersections
- Bowtie intersections
- Directional flyovers
- Center turn overpass
- Grade separated Roundabout
- Diverging diamond grade separation
- Compact diamond grade separation
- Single point urban grade separation
- Traditional urban grade separation

The County has conducted conceptual engineering to define potential improvements at the three study area intersections on Watt Avenue that are currently designated as "High Capacity Intersections" on the County's General Plan. These are:

- At the **Watt Avenue & Folsom Boulevard** intersection, the County proposes an ultimate configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off-ramps from the left lanes of Watt Avenue to a single signalized intersection. A bus rapid transit (BRT) lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal. This design is consistent with the

recommendations of the South Watt Area Transportation Study (SWATS) dated November 1, 2002 and approved by the Board of Supervisors on November 26, 2002, and with the planning study for the *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Kiefer Boulevard** intersection, the County proposes a tight diamond interchange as the ultimate improvement. The through movements (and BRT lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard. This design is proposed in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Jackson Road** intersection, the County proposes a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications. 1) The southbound left-turn movement would be grade separated; 2) The westbound right-turn movement would be grade separated; and 3) Three northbound left-turn lanes are proposed. This configuration represents an enhanced version of Alternative 6 in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr and Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

At the new proposed "High Capacity Intersection" at Bradshaw Road and Jackson Road, the ultimate configuration has not been defined. A number of improvement options involving one or more of the special treatments identified above could be defined that would mitigate the LOS impact at this location.

Additionally, grade separated intersections are proposed along Grant Line Road, in order to meet the Connector JPA's level of service policy. These grade separations would be constructed at Prairie City Road (which is also a designated High Capacity Intersection), White Rock Road, Douglas Road, Kiefer Boulevard, Jackson Road, and Sunrise Boulevard.

Since each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints, etc.), the special treatments utilized at each location will need to be studied to select the treatments that mitigate the LOS impact, while avoiding or minimizing other impacts.

6.5.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Mitigation

According to Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP), all mainline freeway lanes of the 8-lane ultimate facility (4 lanes in each direction) have already been built, with the exception of the segment between Zinfandel Drive and Sunrise Boulevard (where 6 of the 8 ultimate lanes exist today). With the exception of this segment, capacity improvements to widen the freeway mainline are precluded by the ultimate configuration in the TCR/CSMP. The TCR/CSMP does conceptualize other projects that will benefit the US-50 corridor without adding additional mainline travel lanes. These improvements generally fall into one of three categories:

- Intelligent transportation systems (ITS) and integrated corridor management (ICM) projects. Some examples may include ramp metering and multimodal improvements.
- Improvements to parallel local facilities. Such projects are expected to reduce travel demand on US-50.
- Future HOV lanes and auxiliary lanes. These projects would extend, or bridge gaps in, the existing HOV and auxiliary lane network. Constructing these lanes is permissible even when further widening of the mainline is not allowable, and is consistent with the ultimate configuration in the TCR/CSMP.

The FOUR PROJECTS shall participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

6.5.3.1 US-50 Eastbound Alternative Improvements

To lessen the impact to the eastbound US-50 mainline between Stockton Boulevard and 59th Street, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)

6.5.3.2 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 weave between Hazel Avenue and Rancho Cordova Parkway, the project may pay a fair share toward the construction of:

- Multi-modal corridor improvements and interchange improvements at Hazel Avenue (2035 SACOG MTP)
- Auxiliary lanes between Hazel Avenue and Rancho Cordova Parkway (2035 SACOG MTP)

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan or standard intersection geometry, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan or standard intersection geometry, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

6.5.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation

The FOUR PROJECTS applicants shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the FOUR PROJECTS and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the FOUR PROJECTS vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

6.5.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Mitigation

The applicants of the FOUR PROJECTS shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 3.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

6.5.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Mitigation

Table 6.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

6.5.7 CEQA Cumulative Plus FOUR PROJECTS Mitigation Summary

Tables 6.16 through 6.21 summarize the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts, along with the mitigation success for these impacts.

123	Zinfandel Dr	Douglas Rd	Kiefer Blvd	4	Arterial M	22,250	Yes[3]	Widen to County standards [5]	No

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

7. CEQA CUMULATIVE PLUS JACKSON TOWNSHIP (ALTERNATIVE 2) SCENARIO

7.1 JACKSON TOWNSHIP PROJECT DESCRIPTION AND METHODOLOGY

7.1.1 Project Description

As illustrated previously in Figure 1.1, the Jackson Township project is located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the City of Rancho Cordova and Mather Airport. It is bounded on the south by Jackson Road (SR 16) and on the west by Excelsior Road. The north boundary is near the future Kiefer Boulevard, while the east boundary is west of Eagles Nest Road.

7.1.2 Methodology

The analysis of the CEQA Cumulative Plus Jackson Township Project scenario is based upon the analysis of the CEQA Cumulative Plus FOUR PROJECTS scenario discussed in Section 6. The travel model was utilized to estimate the portion of the FOUR PROJECTS traffic that is associated with the Jackson Township project. With this information, it was possible to identify whether the Jackson Township project, on its own, would trigger significant impacts. It should be noted that, even at locations where the Jackson Township project on its own would not trigger a significant impact, the Jackson Township project contributes to the cumulative impacts associated with the CEQA Cumulative Plus FOUR PROJECTS scenario.

7.1.1 CEQA Cumulative Land Use

Section 6.1.1 discusses land use associated with CEQA Cumulative conditions.

7.1.2 Transportation Network

Section 6.1.2 discusses the transportation network associated with the CEQA Cumulative conditions, including the transportation network improvements associated with the FOUR PROJECTS.

7.1.3 Jackson Township Project Trip Generation

The trip generation of the Jackson Township project was estimated by the SACSIM model, which has been utilized to prepare transportation forecasts for this analysis. **Table 7.1** summarizes the person trip generation. The Jackson Township project would generate over 15,000 daily work person trip ends, and over 133,000 daily person trip ends for all trip purposes.

The total trip generation of the Jackson Township project is somewhat higher under the CEQA Cumulative scenario than with existing conditions. The SACSIM model will vary the trips generated by retail and service uses depending on the amount of development that is near those uses. This result is expected as commercial development with much housing and/or employment

nearby will be more successful (and generate more trips) than the same commercial development located in an area with less nearby population.

Table 7.1: Estimated Daily Person Trip Generation (CEQA Cumulative Plus FOUR PROJECTS Alternative 2 Scenario)

Jackson Township Specific Plan

Project	Trip Purpose	Daily Person Trip Ends
Jackson Township	Work Trips	15,296
	Non-Work Trips	117,799
	All Trip Purposes	133,095

Source: *DKS Associates, 2018.*

Table 7.2 summarizes the estimated mode choice for the Jackson Township Project. Over 86 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 2.0 percent of all trips, while walk and bike modes will accommodate about 11.2 percent of all trips.

Table 7.3 summarizes the vehicular (auto) trip generation of the Jackson Township project. The Jackson Township project is estimated to generate over 84,000 daily vehicle trip ends. About 14,300 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the Jackson Township project, about 17 percent of the trip ends. Those internal trip ends represent about 7,150 daily vehicle trips (one-half the number of internal trip ends). The Jackson Township project will generate about 69,900 external vehicle trips that have an origin or destination inside the Jackson Township project but the other end of the trip is outside the Jackson Township project. Table 7.3 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

7.1.4 Jackson Township Project Trip Distribution

The distribution of trips associated with development on the Jackson Township project site was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the Jackson Township project site. Trip distribution varies by land use and time period. **Figure 7.1** illustrates the overall trip distribution of daily Jackson Township project trips with the CEQA Cumulative scenario.

7.2 OPERATIONS ANALYSIS AND IMPACTS

7.2.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Impacts

Table 7.4 summarizes the results of the operations analysis for the study area roadway segments. Only those segments where an impact would be triggered by the Jackson Township project are shown. The table includes the number of lanes assumed with the implementation of the

FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

7.2.2 CEQA Cumulative Plus Jackson Township Project Intersection Impacts

Table 7.5 and 7.6 summarize the results of the operations analysis for the study area intersections. Only those intersections where an impact would be triggered by the Jackson Township project are shown. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 7.6 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 7.5 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Eagles Nest Road and Florin Road

Table 7.2: Mode Split (CEQA Cumulative Plus FOUR PROJECTS Alt. 2 Scenario)

Jackson Township Specific Plan

Project	Mode	Percentage of Person Trips by Trip Purpose		
		Work Trips	Non-Work Trips	All Trip Purposes
Jackson Township	Auto - SOV	81.4%	42.6%	47.1%
	Auto - HOV	9.2%	43.7%	39.7%
	Transit	4.8%	1.7%	2.0%
	Walk	3.3%	11.0%	10.1%
	Bike	1.3%	1.0%	1.1%

Source: *DKS Associates, 2018.*

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

7.2.3 CEQA Cumulative Plus Jackson Township Project U.S. 50 Freeway Impacts

Based upon the Caltrans' thresholds of significance, any volume contribution to a significant impact of the CEQA Cumulative Plus FOUR PROJECTS scenario is considered significant. Therefore, the impacts of the CEQA Cumulative Plus Jackson Township Project scenario are identical to those of the CEQA Cumulative Plus FOUR PROJECTS scenario.

7.2.3.1 Freeway Basic Segments

Table 6.4 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. None of the impacts would be triggered by the Jackson Township project alone.

7.2.3.2 Freeway Merge/Diverge/Weave Segments

Table 6.5 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. None of the impacts would be triggered by the Jackson Township project alone.

7.2.3.3 Freeway Ramp Intersection Queuing

Tables 6.6 and 6.7 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. None of the impacts would be triggered by the Jackson Township project alone.

7.2.4 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts

The Jackson Township project would not remove any existing or planned pedestrian facility. The Jackson Township project would not remove any existing bicycle facility, but would modify facilities that are planned in the Bikeway Master Plan. The Jackson Township project would add pedestrian and bicycle demands within the Jackson Township project site and to and from nearby land uses. As illustrated in Figure 3.2, the Jackson Township project has proposed changes to the Bikeway Master Plan. Because the Jackson Township project would add demand for pedestrian and bicycle facilities that may not be available in the site vicinity, the impact of the Jackson Township project on pedestrian and bicycle circulation is potentially significant.

7.2.5 CEQA Cumulative Plus Jackson Township Project Transit System Impacts

Public transit would not be provided to the site of the Jackson Township project under CEQA Cumulative scenario without development of the Jackson Township project. In the preparation of this analysis, a transit system to serve the FOUR PROJECTS was developed (see Section 3.1.2.3).

However, the timing and implementation of the transit system are uncertain at this time. The Jackson Township project would increase demands for public transit facilities. Therefore, the impact of the Jackson Township project on the transit system is potentially significant.

7.2.6 CEQA Cumulative Plus Jackson Township Project Functionality Impacts

Table 7.7 summarizes the results of the functionality analysis. Only those segments where an impact would be triggered by the Jackson Township project are shown. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

Red text with light gray shading indicate project impacts.

Table 7.7
CEQA Cumulative Plus FOUR PROJECTS (Alternative 2) Functionality Impacts Triggered by Jackson Township Project

ID	Roadway	Segment		Jurisdiction	Existing Substandard Roadways				CEQA Cumulative + FOUR PROJECTS			
		From	To		Travel Lanes	Pavement (ft)	Substandard? [1]	Existing Volume	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

7.3 MITIGATION

7.3.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Mitigation

Table 7.8 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

Table 7.8

Note: Gray shading represents changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, as proposed by the County of Sacramento.

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

7.3.2 CEQA Cumulative Plus Jackson Township Project Intersection Mitigation

Tables 7.9a and 7.10a summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. **Tables 7.9b and 7.10b** summarize the results of the operations analysis for the study area intersections with the ultimate mitigation, which may exceed the County's standard number of approach lanes. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 7.10a and Table 7.10b also identifies those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Grade separated intersections are proposed along Grant Line Road, in order to meet the Connector JPA's level of service policy. These grade separations would be constructed at Prairie City Road (which is also a designated High Capacity Intersection) and Sunrise Boulevard. Since each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints, etc.), the special treatments utilized at each location will need to be studied to select the treatments that mitigate the LOS impact, while avoiding or minimizing other impacts.

7.3.3 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation

The Jackson Township project applicant shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the Jackson Township project and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the Jackson

Township project vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

7.3.4 CEQA Cumulative Plus Jackson Township Project Transit System Mitigation

The applicant of the Jackson Township project shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 3.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

7.3.5 CEQA Cumulative Plus Jackson Township Project Functionality Mitigation

Table 7.11 summarizes the results of the functionality analysis for the rural roadway segments with mitigation.

ID	Roadway	Segment		CEQA Cumulative + FOUR PROJECTS				Mitigation	Impact after Mitigation?
		From	To	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]		

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

7.3.6 CEQA Cumulative Plus Jackson Township Project Mitigation Summary

Tables 7.12 and 7.13 summarize the mitigation success for the roadway segments and intersections that exhibit significant LOS impacts. **Table 7.14** summarizes the mitigation success for the rural roadway segments that exhibit functionality impacts. Tables 7.13 through 7.15 summarize the mitigation success for the freeway system facilities that exhibit significant impacts.

8. EXISTING PLUS JACKSON TOWNSHIP (PROPOSED PROJECT)

8.1 JACKSON TOWNSHIP PROPOSED PROJECT DESCRIPTION

As illustrated previously in Figure 1.1, the Jackson Township project is located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the City of Rancho Cordova and Mather Airport. It is bounded on the south by Jackson Road (SR 16) and on the west by Excelsior Road. The north boundary is near the future Kiefer Boulevard, while the east boundary is west of Eagles Nest Road.

8.1.1 Land Use

Table 8.1 summarizes the Jackson Township project land use.

The SACSIM model (used to estimate travel demand by travel mode) requires estimates of the number and demographics of people who would live in each household as well as key social/economic characteristics of each household. SACOG helped estimate the required household demographics based on the number housing units by density category and detailed local Census data compiled by housing types.

SACSIM also requires employment by type for each parcel in the Jackson Township project. The applicant provided number of acres and square feet by non-residential category on each parcel. Employment estimates were then estimated using average square feet per employee and per student. The total employment in the Jackson Township project was estimated to be about 5,740. The model also requires the estimated enrollment at each school within the Jackson Township project. The total enrollment for grades K-12 was estimated at about 6,000 students. Some of those students would come from housing units outside the Jackson Township project.

8.1.2 Transportation Network

8.1.2.1 Roadway Segments and Intersections

Figure 8.1 illustrates the Jackson Township project transportation network. The Jackson Township project would widen and / or complete many roadways that cross or border the site, and would include new roadways to serve the proposed land use. Sections 3.4.1 and 3.4.2 include information regarding the roadway segment and intersection improvements that are considered part of the Jackson Township project.

8.1.2.2 Pedestrian and Bicycle Facilities

Figure 8.2 illustrates the proposed bikeway plan of the Jackson Township project. The roadways within the Jackson Township project would meet County standards, which would provide sidewalks and on- street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The Jackson Township project also provides several off-street (Class I) multi-purpose trails.

Table 8.1: Land Use Summary for the Jackson Township Specific Plan						
		Residential			Non-Residential	
Land Use Category	Acres	Density Range	Ave Density	Dwelling Units	Floor Area Ratio	Estimated Square Feet
Low Density	355.7	1.0 – 10.9	6.0	2134		
Medium Density	136.3	11.0 – 19.9	13.0	1,772		
High Density	85.5	20.0 – 30.0	25.0	2,137		
High Density Bonus Units				76		
General Commercial	59.3				0.25	645,700
Community Commercial	17.6				0.25	191,600

8.1.2.3 Transit System

Consistent with Sacramento County's General Plan policy LU-120, the Jackson Township project incorporates higher density land uses and mixed uses along transportation corridors to help support transit use. However, as described in Section 2.2, existing transit service is very limited near the Jackson Township project. The transit provider for the area, Sacramento Regional Transit (RT), has developed a long-range transit plan that anticipates three additional high frequency transit lines in the general area by the year 2035. However, even with this additional transit network, the Jackson Township project would likely not meet the County's General Plan policy.

To comply with the County's General Plan Policy LU-120, a separate planning effort involving staff from Sacramento County, RT, DKS, and the applicants of the FOUR PROJECTS was conducted to define an appropriate transit network and frequency that could serve the proposed development in the Jackson Corridor consistent with the intent of the County's policies.

An important consideration in the development of a transit network for the Jackson Corridor is that there are four major development projects proposed in the Jackson Corridor (FOUR PROJECTS) The transit planning effort needed to define standalone transit systems for each of the FOUR PROJECTS that would not only serve the transit needs of each of the FOUR PROJECTS independently, but would also serve as cohesive and complementary transit system units that could operate efficiently together should more than one of the FOUR PROJECTS be approved for development.

A series of transit networks and service frequencies were developed and tested using the SACSIM model with the objective of optimizing transit ridership and the number of boardings. Utilizing RT's performance criteria for evaluating the effectiveness of the various transit lines and service frequencies, an optimum transit network and frequency was developed for the Jackson Corridor.

The planning effort resulted in four transit lines that would serve the FOUR PROJECTS in the Jackson Corridor at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. **Figure 8.3** illustrates the proposed transit system for the Jackson Township project, which represents a portion of the ultimate transit system that would serve the FOUR PROJECTS. The combined transit system for the FOUR PROJECTS is discussed and illustrated in Section 4.1.2.3.

The proposed transit system for the Jackson Township project has been assumed as an attribute of the Jackson Township project and has been included in the traffic modeling for this traffic analysis. The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

8.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the Jackson Township project. **Table 8.2** summarizes the person trip generation. The Jackson Township project would generate over 15,000 daily work person trip ends, and about 115,000 daily person trip ends for all trip purposes.

Table 8.3 summarizes the estimated mode choice for the Existing plus Jackson Township project scenario. About 84.1 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 1.2 percent of all trips, while walk and bike modes will accommodate about 14.7 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 8.4 summarizes the vehicular (auto) trip generation of the Jackson Township project. The Jackson Township project is estimated to generate over 72,500 daily vehicle trip ends. It should be noted that more than one person trip may be accommodated by a vehicle trip (e.g. carpooling). Over 20,500 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the Jackson Township project, over 28 percent of the trip ends. The internal trip ends represent over 10,000 daily vehicle trips (one-half the number of internal trip ends). The Jackson Township project will generate over 52,000 external vehicle trips that have an origin or destination inside the Jackson Township project but the other end of the trip is outside the Jackson Township project. Table 8.4 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

8.3 TRIP DISTRIBUTION

The distribution of trips associated with development on the Jackson Township project site was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the Jackson Township project site. Trip distribution varies by land use and time period. **Figure 8.4** illustrates the overall trip distribution of daily Jackson Township project trips with the Existing Plus Jackson Township project scenario. The highest percentages of Jackson Township project traffic are accommodated on Jackson Road and Excelsior Road.

8.4 OPERATIONS ANALYSIS AND IMPACTS

For purposes of this analysis, full development of the Jackson Township project is assumed to occur "instantaneously." In this manner, the traffic and impacts associated with the Jackson Township project can be directly compared to known and measured conditions. Existing scenario impacts are determined by comparing the traffic operating conditions associated with the Jackson Township project with the traffic operating conditions associated with the existing (without development) conditions, and comparing the change to the thresholds of significance. **Figure 8.5** illustrates the resultant traffic operating conditions.

Table 8.2: Estimated Daily Person Trip Generation (Existing Plus Proposed Project Scenario)

8.4.1 Existing Plus Jackson Township Project Roadway Segment Impacts

Table 8.5 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the Jackson Township project, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways and widened roadways that are assumed part of the Jackson Township project. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the Jackson Township project, which would be greater than the number of lanes in the existing condition. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

8.4.2 Existing Plus Jackson Township Project Intersection Impacts

Tables 8.6 and 8.7 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the Jackson Township project. Table 8.7 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type were assumed to be implemented by the Jackson Township project. Shaded table cells in Table 8.6 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of changes to many of the intersections that are internal to or on the boundary of the Jackson Township project, which would be an improvement over the existing condition. The timing of implementation of such intersection improvements on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Mayhew Road and Jackson Road
- Happy Lane and Old Placerville Road
- Excelsior Road and Elder Creek Road
- Excelsior Road and Florin Road

- Mather Boulevard and Douglas Road
- Eagles Nest Road and Jackson Road
- Excelsior Road and Calvine Road

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

8.4.3 Existing Plus Jackson Township Project U.S. 50 Freeway Impacts

8.4.3.1 Freeway Basic Segments

Table 8.8 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. No locations exhibit significant impacts, based on Caltrans' threshold of significance (5% V/C increase).

8.4.3.2 Freeway Merge / Diverge / Weave Segments

Table 8.9 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Westbound
    - Watt Avenue to Howe Avenue weave - p.m. peak hour

8.4.3.3 Freeway Ramp Intersection Queuing

Table 8.10 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. No locations exhibit a significant impact.

8.4.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts

The Jackson Township project would not remove any existing or planned pedestrian facility. The Jackson Township project would not remove any existing bicycle facility, but would modify facilities that are planned in the Bikeway Master Plan. The Jackson Township project would add pedestrian and bicycle demands within the Jackson Township project site and to and from nearby land uses. As illustrated in Figure 8.2, the Jackson Township project has proposed changes to the Bikeway Master Plan. Because the Jackson Township project would add demand for pedestrian and bicycle facilities that may not be available in the site vicinity, the impact of the Jackson Township project on pedestrian and bicycle circulation is potentially significant.

8.4.5 Existing Plus Jackson Township Project Transit System Impacts

Public transit is not currently provided to the Jackson Township project site. In the preparation of this analysis, a conceptual transit system to serve the Jackson Township project and adjacent future projects was developed (see Section 8.1.2.3). The additional transit service was assumed to be funded by the Jackson Township project. However, the timing and implementation of the transit system are uncertain at this time. The Jackson Township project would increase demands for public transit facilities. Therefore, the impact of the Jackson Township project on the transit system is potentially significant.

8.4.6 Existing Plus Jackson Township Functionality Impacts

Table 8.11 summarizes the results of the rural roadway segment functionality analysis. **Figure 8.6** illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the Jackson Township project, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the Jackson Township project. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the project makes improvements to a roadway segment such as widening, it would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the Jackson Township project would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the Jackson Township project, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the Jackson Township project.

Table 8.11
Existing Plus Jackson Township Project (Proposed Project) Functionality Impacts

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

8.5 MITIGATION

8.5.1 Existing Plus Jackson Township Project Roadway Segment Mitigation

Table 8.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the Jackson Township project to implement. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

8.5.2 Existing Plus Jackson Township Project Intersection Mitigation

Tables 8.13 and 8.14 summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. Shaded table cells in Table 8.14 indicate those locations where changes in traffic control and / or number of approach lanes by type have been made which would be the responsibility of the Jackson Township project to implement. As shown in Table 8.13, all LOS impacts have been fully mitigated. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column in Table 8.14 shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

8.5.3 Existing Plus Jackson Township Project U.S. 50 Freeway Mitigation

Capacity improvements such as widening of the freeway and freeway junctions would reduce the severity of the impacts, but were generally not considered feasible due to right-of-way

restrictions, legal constraints, and the numerous transportation structures that would need to be modified and/or replaced. Potential alternative improvements have been identified from Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP). The TCR and CSMP is focused on intelligent transportation systems (ITS) and integrated corridor management (ICM) projects that would have operational benefits to US-50 without adding additional capacity. The TCR and CSMP also identify potential improvements to parallel local facilities that would be expected to reduce travel demand on US-50. The Jackson Township project will participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

8.5.3.1 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 weave between Watt Avenue and Howe Avenue, the project may pay a fair share toward the construction of:

- Bus/HOV lanes from Watt Avenue to Downtown Sacramento (2035 SACOG MTP)
- Replacement of existing communication lines with fiber optics to improve performance between SR-51/SR-99 and Watt Avenue (2013 10-Year SHOPP Plan)
- Auxiliary lane between the NB Howe Avenue on-ramp and the SB Howe Avenue on-ramp (2035 SACOG MTP)
- Ramp meter improvements (Caltrans ITS/OPS Project List)

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes that the project is responsible to provide.

8.5.4 Existing Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation

The Jackson Township project applicant shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the Jackson Township project and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the Jackson Township project vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

8.5.5 Existing Plus Jackson Township Project Transit System Mitigation

The Jackson Township project applicant shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 8.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

8.5.6 Existing Plus Jackson Township Project Functionality Mitigation

Table 8.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

8.5.7 Existing Plus Jackson Township Project Mitigation Summary

Tables 8.16 through 8.19 summarize all of the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts along with the mitigation success for these impacts.

9. EXISTING PLUS FOUR PROJECTS SCENARIO (JACKSON TOWNSHIP PROPOSED PROJECT)

9.1 PROJECT DESCRIPTION

The existing plus FOUR PROJECTS scenario evaluates the effects of the traffic of four developments (FOUR PROJECTS) added to existing conditions. **Figure 9.1** illustrates the location of the FOUR PROJECTS:

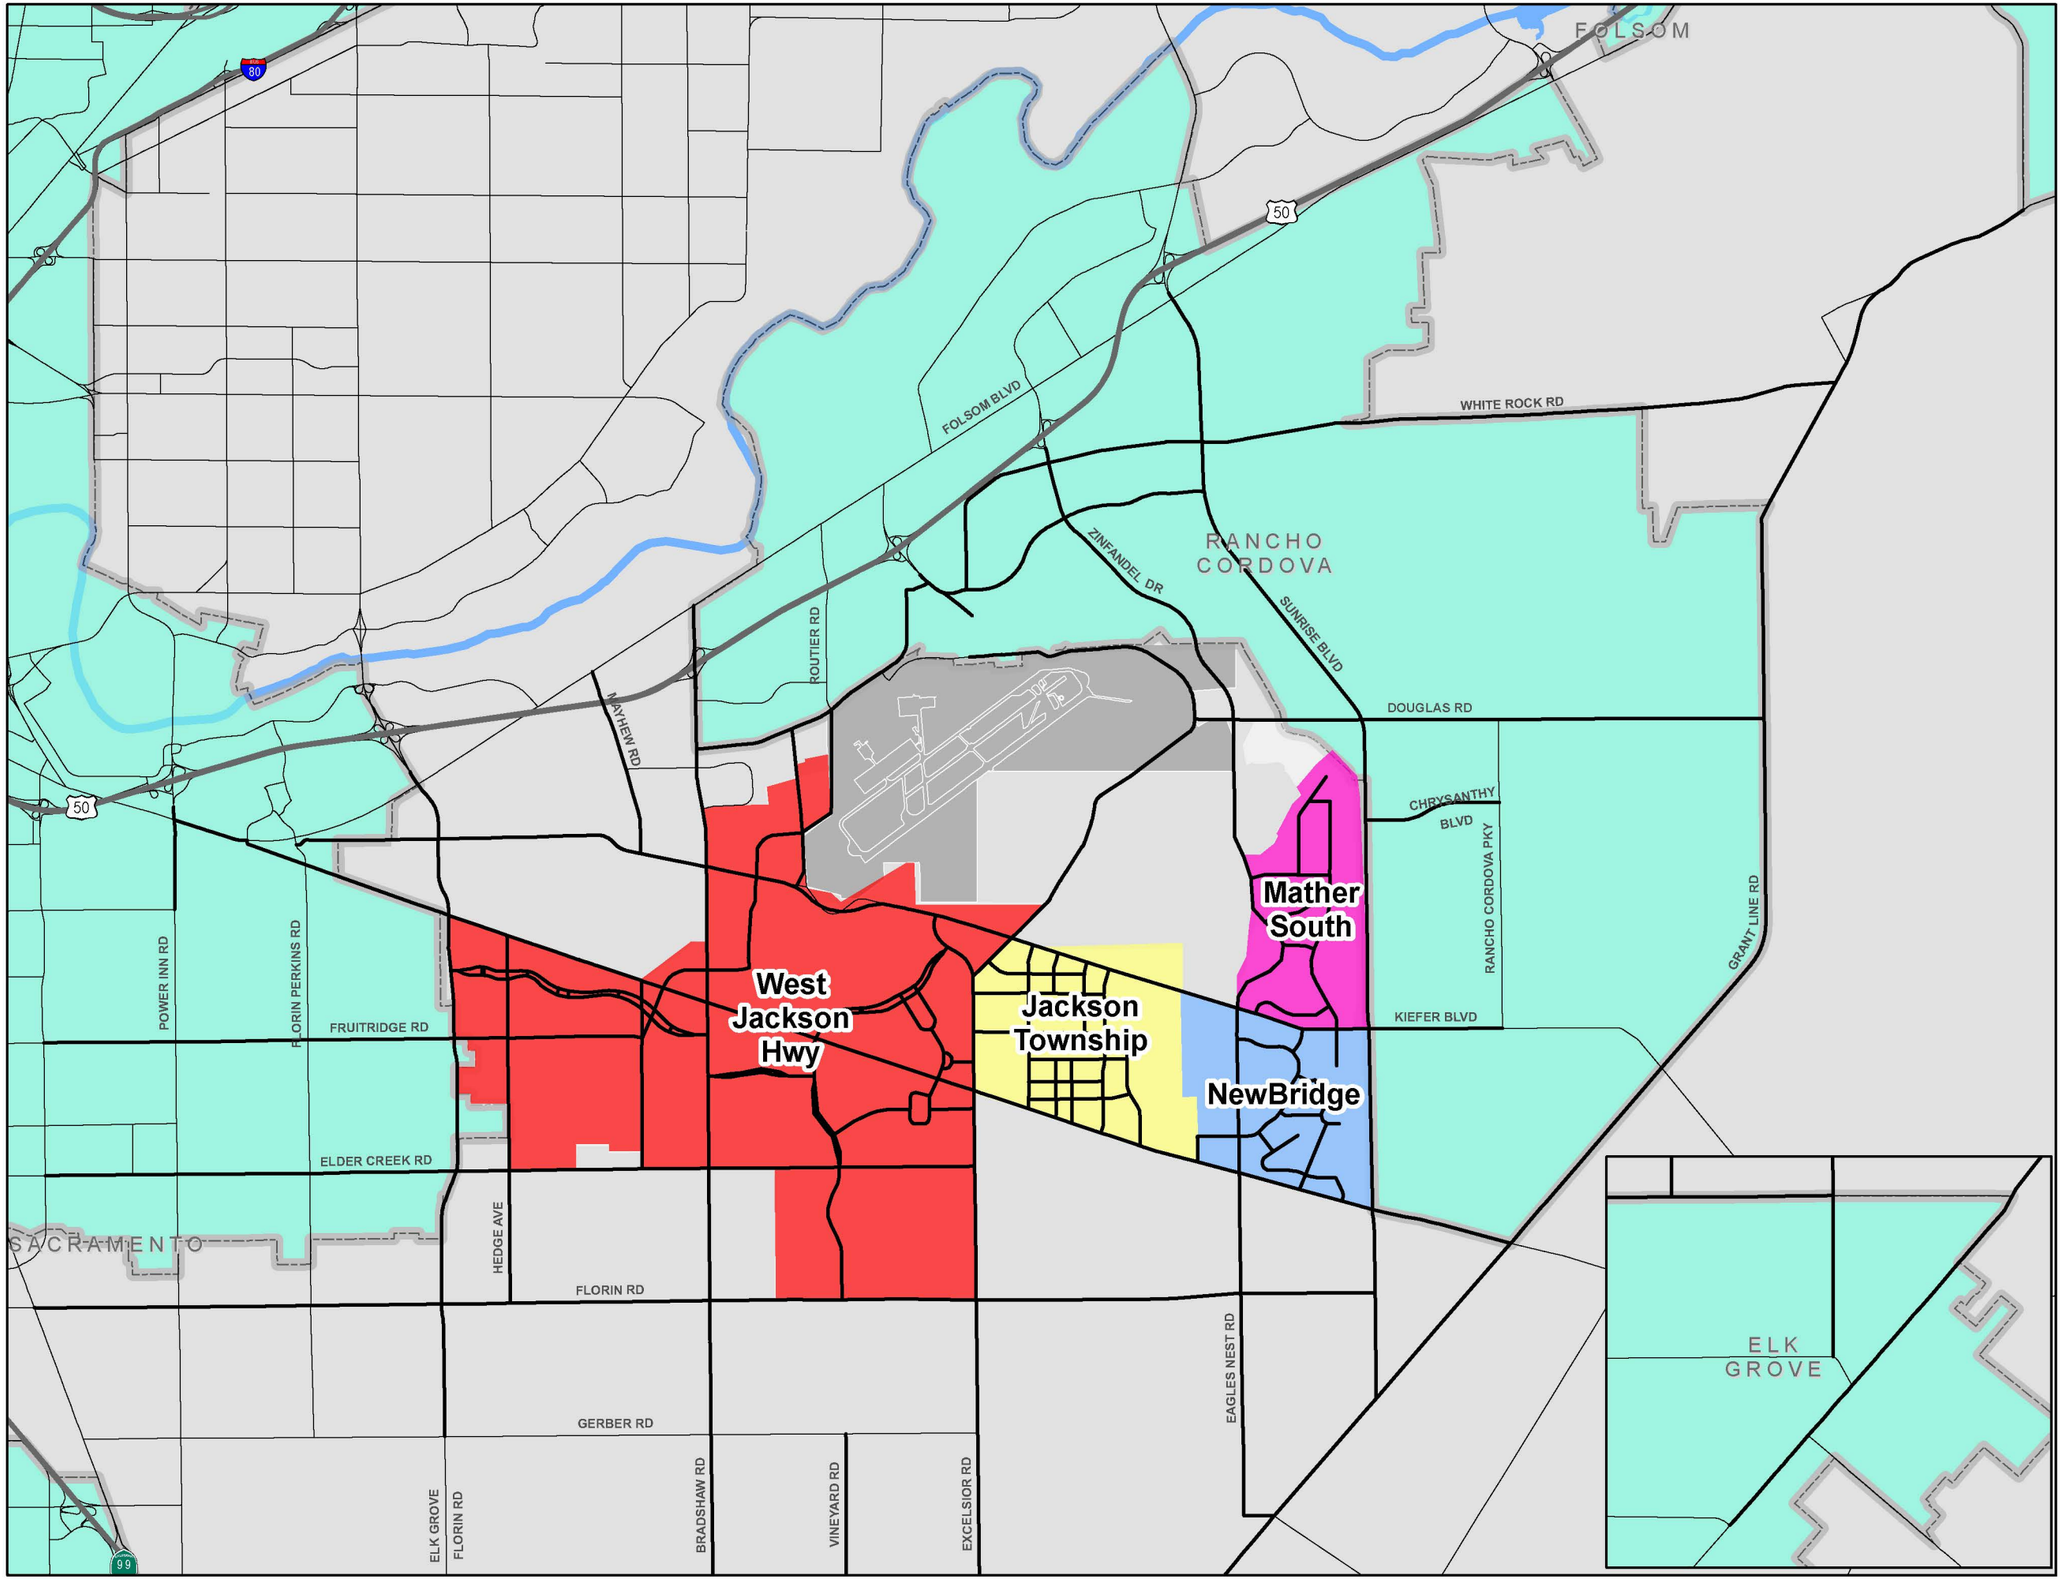
- West Jackson
- Jackson Township
- NewBridge
- Mather South

The FOUR PROJECTS are located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the community of Rosemont and the City of Rancho Cordova. The FOUR PROJECTS are located both north and south of Jackson Road (SR 16). The FOUR PROJECTS are generally bounded to the west by South Watt Avenue, to the north by the Community of Rosemont and Mather Airport, to the east by Sunrise Boulevard, and to the south by Elder Creek Road and Florin Road.

9.1.1 Land Use

Table 9.1 summarizes the land use assumptions for the FOUR PROJECTS in Jackson Corridor. Together, the FOUR PROJECTS would contain over 29,100 dwelling units and contain enough non-residential land uses to employ over 38,100 workers.

9.1.2 Transportation Network



9.1.2.1 Roadway Segments and Intersections

Figure 9.2 illustrates the FOUR PROJECTS transportation network. The FOUR PROJECTS would widen and / or complete many roadways that cross or border the FOUR PROJECTS sites. The FOUR PROJECTS would improve many intersections within or on the borders of the projects. In addition, the FOUR PROJECTS would include new roadways to serve the proposed land use. The proposed improvements associated with the FOUR PROJECTS are summarized later in Sections 9.2.1 and 9.2.2.

9.1.2.2 Pedestrian and Bicycle Facilities

The roadways within the FOUR PROJECTS would meet County standards, which would provide sidewalks and on-street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The FOUR PROJECTS also provide several off-street (Class I) multi-purpose trails.

9.1.2.3 Transit System

As described in Section 2.2, transit service in the vicinity of the FOUR PROJECTS is very limited. The FOUR PROJECTS are designed with significant amounts of higher density and mixed uses to help support transit use but transit service within walking distances of those uses is required to achieve significant transit ridership.

An accurate estimation of transit use requires the definition of specific transit routes and frequency of service on those routes. A separate planning effort, involving staff from Sacramento County and Sacramento Regional Transit (RT), was conducted to define an appropriate transit system for the transportation analysis. That effort is described in Section 8.1.2.3.

The planning effort resulted in four transit lines that would serve the FOUR PROJECTS at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. Another key characteristic of the proposed transit system built into the modeling assumptions is the targeted use of queue jumps on portions of key corridors (Bradshaw Road from Kiefer Boulevard to Rock Creek Parkway, and Jackson Road from Watt Avenue to Excelsior Road). Queue jumps ensure that buses are not excessively delayed at signals along congested corridors, and therefore not too heavily penalized from a travel time perspective. This is necessary to achieve the adequate ridership levels that were forecast and ensure reliable operations. **Figure 9.3** shows the assumed transit routes for this scenario.

The assumed transit routes, service frequency, and supporting infrastructure (i.e. queue jumps) would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

9.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the FOUR PROJECTS. **Table 9.2** summarizes the person trip generation. The FOUR PROJECTS would generate over 85,000 daily work person trip ends, and over ,000 daily person trip ends for all trip purposes.

Table 9.3 summarizes the estimated mode choice for the Existing plus FOUR PROJECTS scenario. About 90.9 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 1.5 percent of all trips, while walk and bike modes will accommodate about 7.6 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 9.4 summarizes the vehicular (auto) trip generation of the FOUR PROJECTS. The FOUR PROJECTS are estimated to generate over 463,000 daily vehicle trip ends. About 100,000 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the

individual projects, over 21 percent of the trip ends. The internal trip ends represent about 50,000 daily vehicle trips (one-half the number of internal trip ends). The FOUR PROJECTS will generate about 363,000 external vehicle trips that have an origin or destination inside one of the FOUR PROJECTS but the other end of the trip is outside the project from which it originated. Table 9.4 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

Table 9.2: Estimated Daily Person Trip Generation
Existing Plus FOUR PROJECTS Scenario (Proposed Project)

Trip Purpose	Daily Person Trip Ends
Work Trips	85,644
Non-Work Trips	590,680
All Trip Purposes	676,324

Existing Plus FOUR PROJECTS Scenario (Proposed Project)

Trip Type		AM Peak Hour	PM Peak Hour	Daily
Total Vehicle Trip Ends		40,317	43,108	463,209
Percent Internal Trip Ends[1]		18.2%	21.8%	21.6%
Vehicle Trips	Internal to Projects	3,675	4,706	50,087
	External to Projects	32.966	33,696	363,034
	Total	36,642	38,402	413,122

[1.] Both trip ends within individual projects.

Source: *DKS Associates, 2018.*

9.3 TRIP DISTRIBUTION

The distribution of trips associated with development of the FOUR PROJECTS was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the FOUR PROJECTS. Trip distribution varies by land use and time period. **Figure 9.4** illustrates the overall trip distribution of daily FOUR PROJECTS trips with the Existing Plus FOUR PROJECTS scenario. The highest percentages of FOUR PROJECTS traffic are accommodated on Jackson Road, Bradshaw Road, Kiefer Boulevard, and Vineyard Road.

9.4 OPERATIONS ANALYSIS AND IMPACTS

For purposes of this analysis, full development of the FOUR PROJECTS is assumed to occur "instantaneously." In this manner, the traffic and impacts associated with the FOUR PROJECTS can be directly compared to known and measured conditions. Existing scenario impacts are determined by comparing the traffic operating conditions associated with the FOUR PROJECTS with the traffic operating conditions associated with the existing (without FOUR PROJECTS) conditions, and comparing the change to the thresholds of significance. **Figure 9.5** illustrates the resultant traffic operating conditions.

9.4.1 Existing Plus FOUR PROJECTS Roadway Segment Impacts

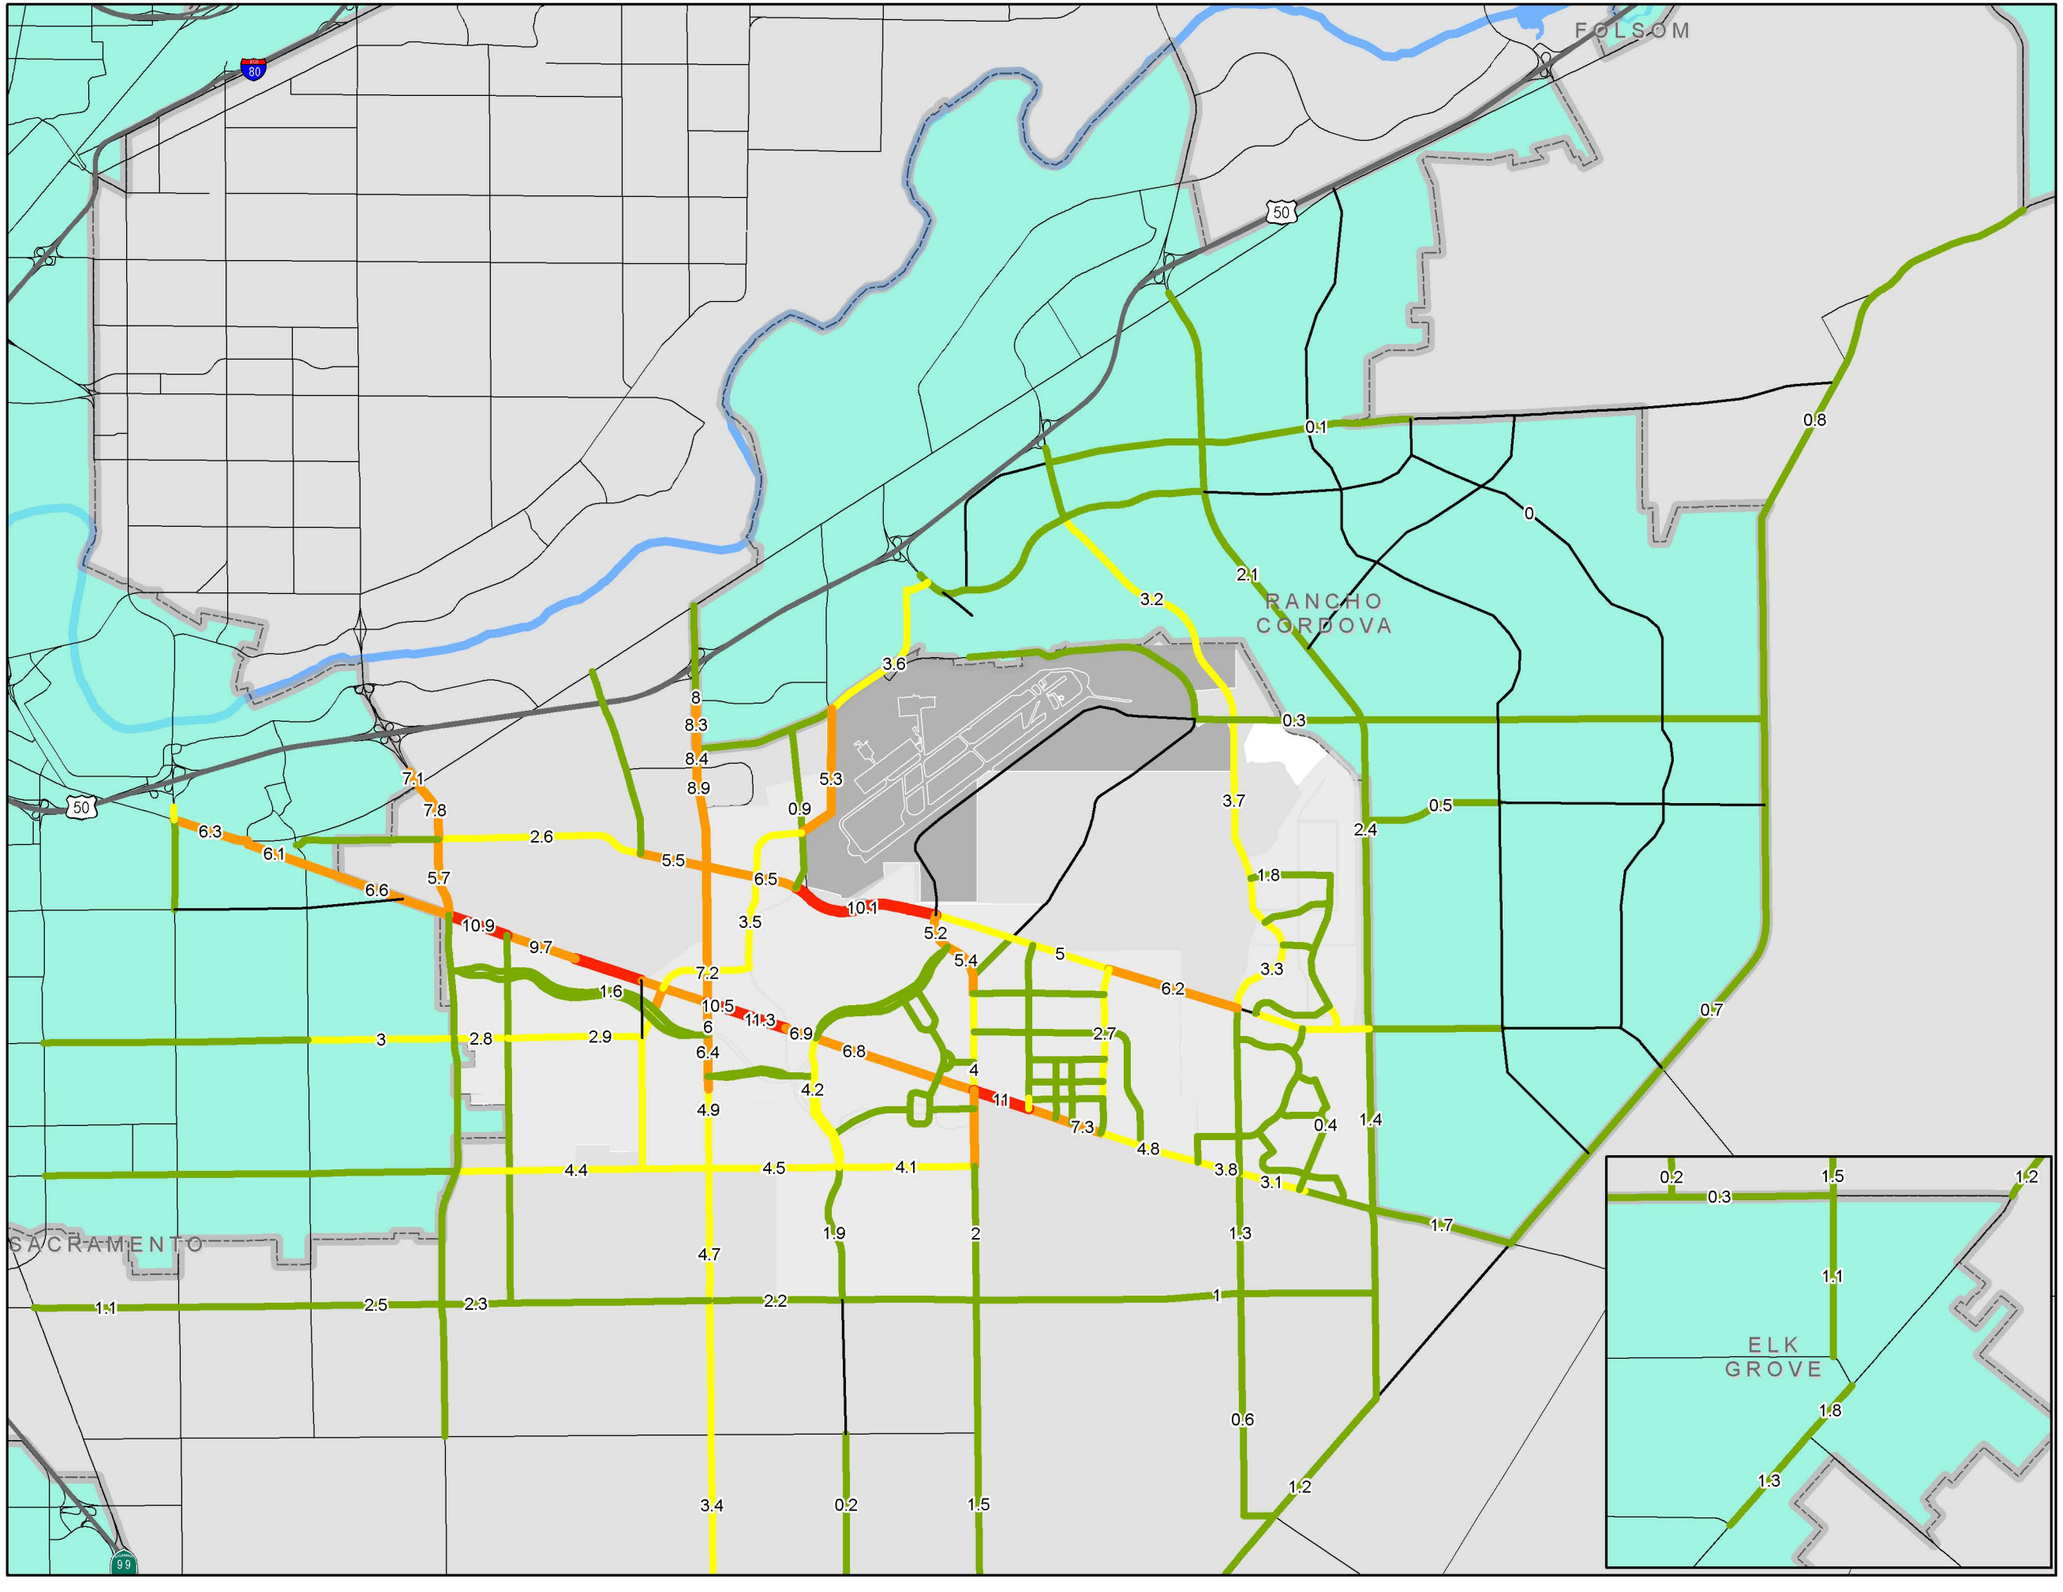

Table 9.5 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

Table 9.5
Existing Plus FOUR PROJECTS (Proposed Project) Roadway Segment Levels of Service

ID	Roadway	Segment		Existing					Existing + FOUR PROJECTS					Project(s) Responsible for Change in Lanes
		From	To	Travel Lanes	Facility Type[1]	Daily Volume	Volume / Capacity Ratio	Level of Service	Travel Lanes	Facility Type[1]	Forecasted Volume	Volume/ Capacity Ratio	Level of Service	

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

9.4.2 Existing Plus FOUR PROJECTS Intersection Impacts

Tables 9.6 and 9.7 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 9.7 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 9.6 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Hedge Avenue and Florin Road
- Happy Lane and Old Placerville Road
- Excelsior Road and Gerber Road
- Eagles Nest Road and Florin Road
- Excelsior Road and Calvine Road

9.4.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Impacts

9.4.3.1 Freeway Basic Segments

Table 9.8 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound US 50
    - Stockton Boulevard to 59th Street - a.m. peak hour
    - Zinfandel Drive to Hazel Avenue - p.m. peak hour
- Westbound US 50
    - Watt Avenue to SR 99 / SR 51 - p.m. peak hour

9.4.3.2 Freeway Merge/Diverge/Weave Segments

Table 9.9 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound
    - 65th Street to Howe Avenue weave - a.m. peak hour
    - Mather Field Road to Zinfandel Drive weave - a.m. peak hour

9.4.3.3 Freeway Ramp Intersection Queuing

Table 9.10 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. No locations exhibit a significant impact.

9.4.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts

The FOUR PROJECTS would not remove any existing or planned pedestrian facility. The FOUR PROJECTS would not remove any existing bicycle facility or any facility that is planned in the Bikeway Master Plan. The FOUR PROJECTS would add pedestrian and bicycle demands within the FOUR PROJECTS site and to and from nearby land uses. Complete information on improvements to on- and off-site bicycle and pedestrian facilities is not available at this time. Because the FOUR PROJECTS would add demand for pedestrian and bicycle facilities that may not be available, the impact of the FOUR PROJECTS on pedestrian and bicycle circulation is potentially significant.

9.4.5 Existing Plus FOUR PROJECTS Transit System Impacts

Public transit service is currently limited in the vicinity of the FOUR PROJECTS. In the preparation of this analysis, a conceptual transit system to serve the FOUR PROJECTS was developed (see Section 8.1.2.3). The additional transit service was assumed to be funded by the FOUR PROJECTS. However, the timing and implementation of the transit system are uncertain at this time. The FOUR PROJECTS would increase demands for public transit facilities. Therefore, the impact of the FOUR PROJECTS on the transit system is potentially significant.

9.4.6 Existing Plus FOUR PROJECTS Functionality Impacts

Table 9.11 summarizes the results of the rural roadway segment functionality analysis. **Figure 9.6** illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

Table 9.11
Existing Plus FOUR PROJECTS (Proposed Project) Functionality Impacts

ID	Roadway	Segment		Jurisdiction	Existing Substandard Roadways				Existing + FOUR PROJECTS

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

9.5 MITIGATION

9.5.1 Existing Plus FOUR PROJECTS Roadway Segment Mitigation

Table 9.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund and provide. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

9.5.2 Existing Plus FOUR PROJECTS Intersection Mitigation

Tables 9.13 and 9.14 summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. Shaded table cells in Table 4.14 indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund and provide. The Jackson Township project would contribute a fair share. The shaded table cells in Table 9.13 under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 9.14 also identifies those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Three intersections are currently designated as "High Capacity Intersections" on the County's General Plan: Watt Avenue & Folsom Boulevard, Watt Avenue & Kiefer Boulevard, and Watt Avenue & Jackson Road.

A high capacity intersection would utilize special treatments to increase the capacity of the intersection so as to reduce congestion and travel delay. Since each intersection could have unique travel movements, volumes and existing context sensitive conditions, the special treatments utilized at each high capacity intersection will be selected to meet the specific needs of each intersection. The range of special treatments is quite wide, ranging from the restriction of certain turning movements to various combinations that could include grade separating certain movements. While the field of traffic engineering is ever expending and evolving resulting in the use of new technologies and treatments, special treatments such as the following could be utilized at a high capacity intersection:

- Restricting turning movements
- Median U-turns
- Roundabouts
- Split intersections
- Quadrant roadway intersections
- Bowtie intersections
- Directional flyovers
- Center turn overpass
- Grade separated Roundabout
- Diverging diamond grade separation
- Compact diamond grade separation
- Single point urban grade separation
- Traditional urban grade separation

The County has conducted conceptual engineering to define potential improvements at the three study area intersections on Watt Avenue that are currently designated as "High Capacity Intersections" on the County's General Plan. These are:

- At the **Watt Avenue & Folsom Boulevard** intersection, the County proposes an ultimate configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off-ramps from the left lanes of Watt Avenue to a single signalized intersection. A bus rapid transit (BRT) lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal. This design is consistent with the recommendations of the South Watt Area Transportation Study (SWATS) dated November 1, 2002 and approved by the Board of Supervisors on November 26, 2002, and with the planning study for the *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of

Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Kiefer Boulevard** intersection, the County proposes a tight diamond interchange as the ultimate improvement. The through movements (and BRT lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard. This design is proposed in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Jackson Road** intersection, the County proposes a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications. 1) The southbound left-turn movement would be grade separated; 2) The westbound right-turn movement would be grade separated; and 3) Three northbound left-turn lanes are proposed. This configuration represents an enhanced version of Alternative 6 in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr and Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

9.5.3 Existing Plus FOUR PROJECTS U.S. 50 Freeway Mitigation

According to Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP), all mainline freeway lanes of the 8-lane ultimate facility (4 lanes in each direction) have already been built, with the exception of the segment between Zinfandel Drive and Sunrise Boulevard (where 6 of the 8 ultimate lanes exist today). With the exception of this segment, capacity improvements to widen the freeway mainline are precluded by the ultimate configuration in the TCR/CSMP. The TCR/CSMP does conceptualize other projects that will benefit the US-50 corridor without adding additional mainline travel lanes. These improvements generally fall into one of three categories:

- Intelligent transportation systems (ITS) and integrated corridor management (ICM) projects. Some examples may include ramp metering and multimodal improvements.
- Improvements to parallel local facilities. Such projects are expected to reduce travel demand on US-50.
- Future HOV lanes and auxiliary lanes. These projects would extend, or bridge gaps in, the existing HOV and auxiliary lane network. Constructing these lanes is permissible even when further widening of the mainline is not allowable, and is consistent with the ultimate configuration in the TCR/CSMP.

The FOUR PROJECTS shall participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

9.5.3.1 US-50 Eastbound Alternative Improvements

To lessen the impact to the eastbound US-50 mainline between Stockton Boulevard and 59th Street, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)

To lessen the impact to the eastbound US-50 weave between 65th Street and Howe Avenue, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)
- Widen 65th Street to 5 lanes from US-50 to Broadway (2035 SACOG MTP)

To lessen the impact to the eastbound US-50 weave between Mather Field Road and Zinfandel Drive, the project may pay a fair share toward the construction of:

- An interchange modification of US-50 at Mather Field Road (2035 SACOG MTP)

To lessen the impact to the eastbound US-50 mainline between Zinfandel Drive and Hazel Avenue, the project may pay a fair share toward the construction of:

- Auxiliary lanes between Zinfandel Drive and Sunrise Boulevard (2035 SACOG MTP)
- Auxiliary lanes between Sunrise Boulevard and Hazel Avenue (2035 SACOG MTP)
- Widen Sunrise Boulevard to 6 lanes with special treatments, including intersection improvements at White Rock Road, Folsom Boulevard, Coloma Road, Gold Express Drive, and Gold Country Boulevard (2035 SACOG MTP)
- A new interchange at Rancho Cordova Parkway, including a 4-lane arterial from US-50 to White Rock Road (2035 SACOG MTP)

- Multi-modal corridor improvements and interchange improvements at Hazel Avenue (2035 SACOG MTP)

9.5.3.2 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 mainline between Watt Avenue and SR-51/SR-99, the project may pay a fair share toward the construction of:

- Bus/HOV lanes from Watt Avenue to Downtown Sacramento (2035 SACOG MTP)
- Replacement of existing communication lines with fiber optics to improve performance between SR-51/SR-99 and Watt Avenue (2013 10-Year SHOPP Plan)
- Auxiliary lane between the NB Howe Avenue on-ramp and the SB Howe Avenue on-ramp (2035 SACOG MTP)
- Ramp meter improvements (Caltrans ITS/OPS Project List)

9.5.4 Existing Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation

The FOUR PROJECTS applicants shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the FOUR PROJECTS and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the FOUR PROJECTS vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

9.5.5 Existing Plus FOUR PROJECTS Transit System Mitigation

The applicants of the FOUR PROJECTS shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 8.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

9.5.6 Existing Plus FOUR PROJECTS Functionality Mitigation

Table 9.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

9.5.7 Existing Plus FOUR PROJECTS Mitigation Summary

Tables 9.16 through 9.21 summarize all of the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts along with the mitigation success for these impacts.

Red text with light gray shading indicate project impacts.

Table 9.15
Existing Plus FOUR PROJECTS (Proposed Project) Functionality Mitigations

ID	Roadway	Segment		Existing + FOUR PROJECTS				Mitigation	Impact after Mitigation?
		From	To	Travel Lanes	Substandard? [1]	Forecasted Volume	Functionality Impact? [2]		

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.
[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.
[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.
[4] Excluding the roadway segment that is within the developed community of Independence at Mather.
[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

10. CEQA CUMULATIVE PLUS FOUR PROJECTS SCENARIO (JACKSON TOWNSHIP PROPOSED PROJECT)

10.1 FOUR PROJECTS DESCRIPTION

The CEQA Cumulative plus FOUR PROJECTS scenario evaluates the effects of the traffic of four developments added to CEQA Cumulative conditions. Figure 9.1 illustrates the location of the FOUR PROJECTS:

- West Jackson Highway Master Plan (West Jackson)
- Jackson Township Specific Plan (Jackson Township)
- NewBridge Specific Plan (NewBridge)
- Mather South Specific Plan Amendment (Mather South)

10.1.1 CEQA Cumulative Land Use

Outside the FOUR PROJECTS area (see Figure 10.1), SACOG's 2035 development forecasts (the amount and location of housing and employment) for the adopted 2012 Metropolitan Transportation Plan (MTP) were used to prepare travel demand forecasts for this scenario. In addition, full build out of all reasonably foreseeable development projects was assumed within the study area, including the following major developments:

- Unincorporated Sacramento County
  - Vineyard Springs Comprehensive Plan
  - North Vineyard Station Specific Plan
  - Florin Vineyard Gap Community Plan
  - Mather Airport Specific Plan
  - Cordova Hills
  - Easton
  - Glenborough
  - East County Quarries

- City of Ranch Cordova
  - Arboretum
  - Suncreek
  - Sunridge Ranch
  - Rio del Oro
  - Westborough

- City of Folsom
  - Folsom South of 50 Specific Plan

- City of Sacramento
  - Aspen 1

10.1.2 Transportation Network

Figure 10.1 illustrates the transportation network associated with the CEQA Cumulative without FOUR PROJECTS scenario. Outside the FOUR PROJECTS area (see Figure 9.1), it consists of the improvements through 2035 in the adopted 2012 Metropolitan Transportation Plan (MTP). Within the FOUR PROJECTS area, it includes roadway improvements beyond those in the MTP, which would be fully funded by the developments assumed in this scenario or by other committed funding sources. Sacramento County staff helped define such improvements and the number of roadway lanes for this scenario.

Figure 10.2 illustrates the transportation network associated with the CEQA Cumulative with FOUR PROJECTS scenario. The FOUR PROJECTS would construct new roadways within their sites, and widen many existing roadways within or on the borders of their sites. Details of this expansion of the roadway system is included in Section 10.2.1.

10.1.2.3 Pedestrian and Bicycle Facilities

The roadways within the FOUR PROJECTS would meet County standards, which would provide sidewalks and on-street (Class II) bike lanes on all collector, arterial and thoroughfare roadways. The FOUR PROJECTS also provide several off-street (Class I) multi-purpose trails.

10.1.2.4 Transit System

The FOUR PROJECTS are designed with significant amounts of higher density and mixed uses to help support transit use but transit service within walking distances of those uses is required to achieve a significant transit ridership. An accurate estimation of transit use requires the definition of specific transit routes and frequency of service on those routes. A separate planning effort, involving staff from Sacramento County and Sacramento Regional Transit (RT), was conducted to define an appropriate transit system for the transportation analysis. That effort is described in Section 8.1.2.3.

The planning effort resulted in four transit lines that would serve the FOUR PROJECTS at a frequency of 15 minutes during the peak commute hours (approximately 6-9 AM and 3-6 PM) and 30 minutes during off-peak service hours (approximately 9AM-3PM and 6PM-8PM) on weekdays. Another key characteristic of the proposed transit system built into the modeling assumptions is the targeted use of queue jumps on portions of key corridors (Bradshaw Road from Kiefer Boulevard to Rock Creek Parkway, and Jackson Road from Watt Avenue to Excelsior Road). Queue jumps ensure that buses are not excessively delayed at signals along congested corridors, and therefore not too heavily penalized from a travel time perspective. This is necessary to achieve the adequate ridership levels that were forecast and ensure reliable operations. **Figure 10.3** shows the assumed transit routes for this scenario.

The assumed transit routes, service frequency, and supporting infrastructure (i.e. queue jumps) would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the

ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

10.2 TRIP GENERATION

The SACSIM model that has been utilized for the transportation forecasts in this analysis estimated trip generation of the Jackson Township project. **Table 10.2** summarizes the person trip generation. The Jackson Township project would generate over 95,000 daily work person trip ends, and over 804,000 daily person trip ends for all trip purposes.

Table 10.3 summarizes the estimated mode choice for the Existing plus Jackson Township project scenario. About 90.4 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 2.0 percent of all trips, while walk and bike modes will accommodate about 7.7 percent of all trips. The mode choice assumes full implementation of the project's pedestrian and bicycle systems.

Table 10.4 summarizes the vehicular (auto) trip generation of the Jackson Township project. The Jackson Township project is estimated to generate over 541,000 daily vehicle trip ends. It should be noted that more than one person trip may be accommodated by a vehicle trip (e.g. carpooling). Over 107,000 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the Jackson Township project, about 20 percent of the trip ends. The internal trip ends represent over 53,500 daily vehicle trips (one-half the number of internal trip ends). The Jackson Township project will generate about 434,000 external vehicle trips that have an origin or destination inside the Jackson Township project but the other end of the trip is outside the Jackson Township project. Table 10.4 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

10.3 TRIP DISTRIBUTION

The distribution of trips associated with development of the FOUR PROJECTS was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the FOUR PROJECTS. Trip distribution varies by land use and time period. **Figure 10.4** illustrates the overall trip distribution of daily FOUR PROJECTS trips with the CEQA Plus FOUR PROJECTS scenario. The highest percentages of FOUR PROJECTS traffic are accommodated on Jackson Road, Bradshaw Road, Kiefer Boulevard, and Vineyard Road.

Table 10.1: Estimated Daily Person Trip Generation
CEQA Cumulative Plus FOUR PROJECTS (Proposed Project)

Trip Purpose	Daily Person Trip Ends
Work Trips	95,402
Non-Work Trips	708,805
All Trip Purposes	804,206

Source: *DKS Associates, 2018.*

Table 10.2: Mode Split
CEQA Cumulative Plus FOUR PROJECTS (Proposed Project)

Mode	Percentage of Person Trips by Trip Purpose		
	Work Trips	Non-Work Trips	All Trip Purposes
Auto - SOV	83.2%	47.0%	51.3%
Auto - HOV	10.0%	43.0%	39.1%
Transit	4.6%	1.7%	2.0%
Walk	1.3%	7.4%	6.7%
Bike	0.1%	1.0%	1.0%

(JT PROPOSED PROJECT)

10.4 OPERATIONS ANALYSIS AND IMPACTS

Cumulative scenario impacts are determined by comparing the traffic operating conditions associated with the FOUR PROJECTS with the traffic operating conditions associated with the cumulative (without FOUR PROJECTS) conditions, and comparing the change to the thresholds of significance. **Figure 10.5** illustrates the resultant traffic operating conditions associated with the CEQA Cumulative (without FOUR PROJECTS) scenario. **Figure 10.6** illustrates the resultant traffic operating conditions associated with the CEQA Cumulative Plus FOUR PROJECTS scenario.

10.4.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Impacts

Table 10.4 summarizes the results of the operations analysis for the study area roadway segments. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

10.4.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Impacts

Table 10.5 and 10.6 summarize the results of the operations analysis for the study area intersections. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 10.6 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 10.5 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Happy Lane and Old Placerville Road
- Eagles Nest Road and Florin Road

10.4.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Impacts

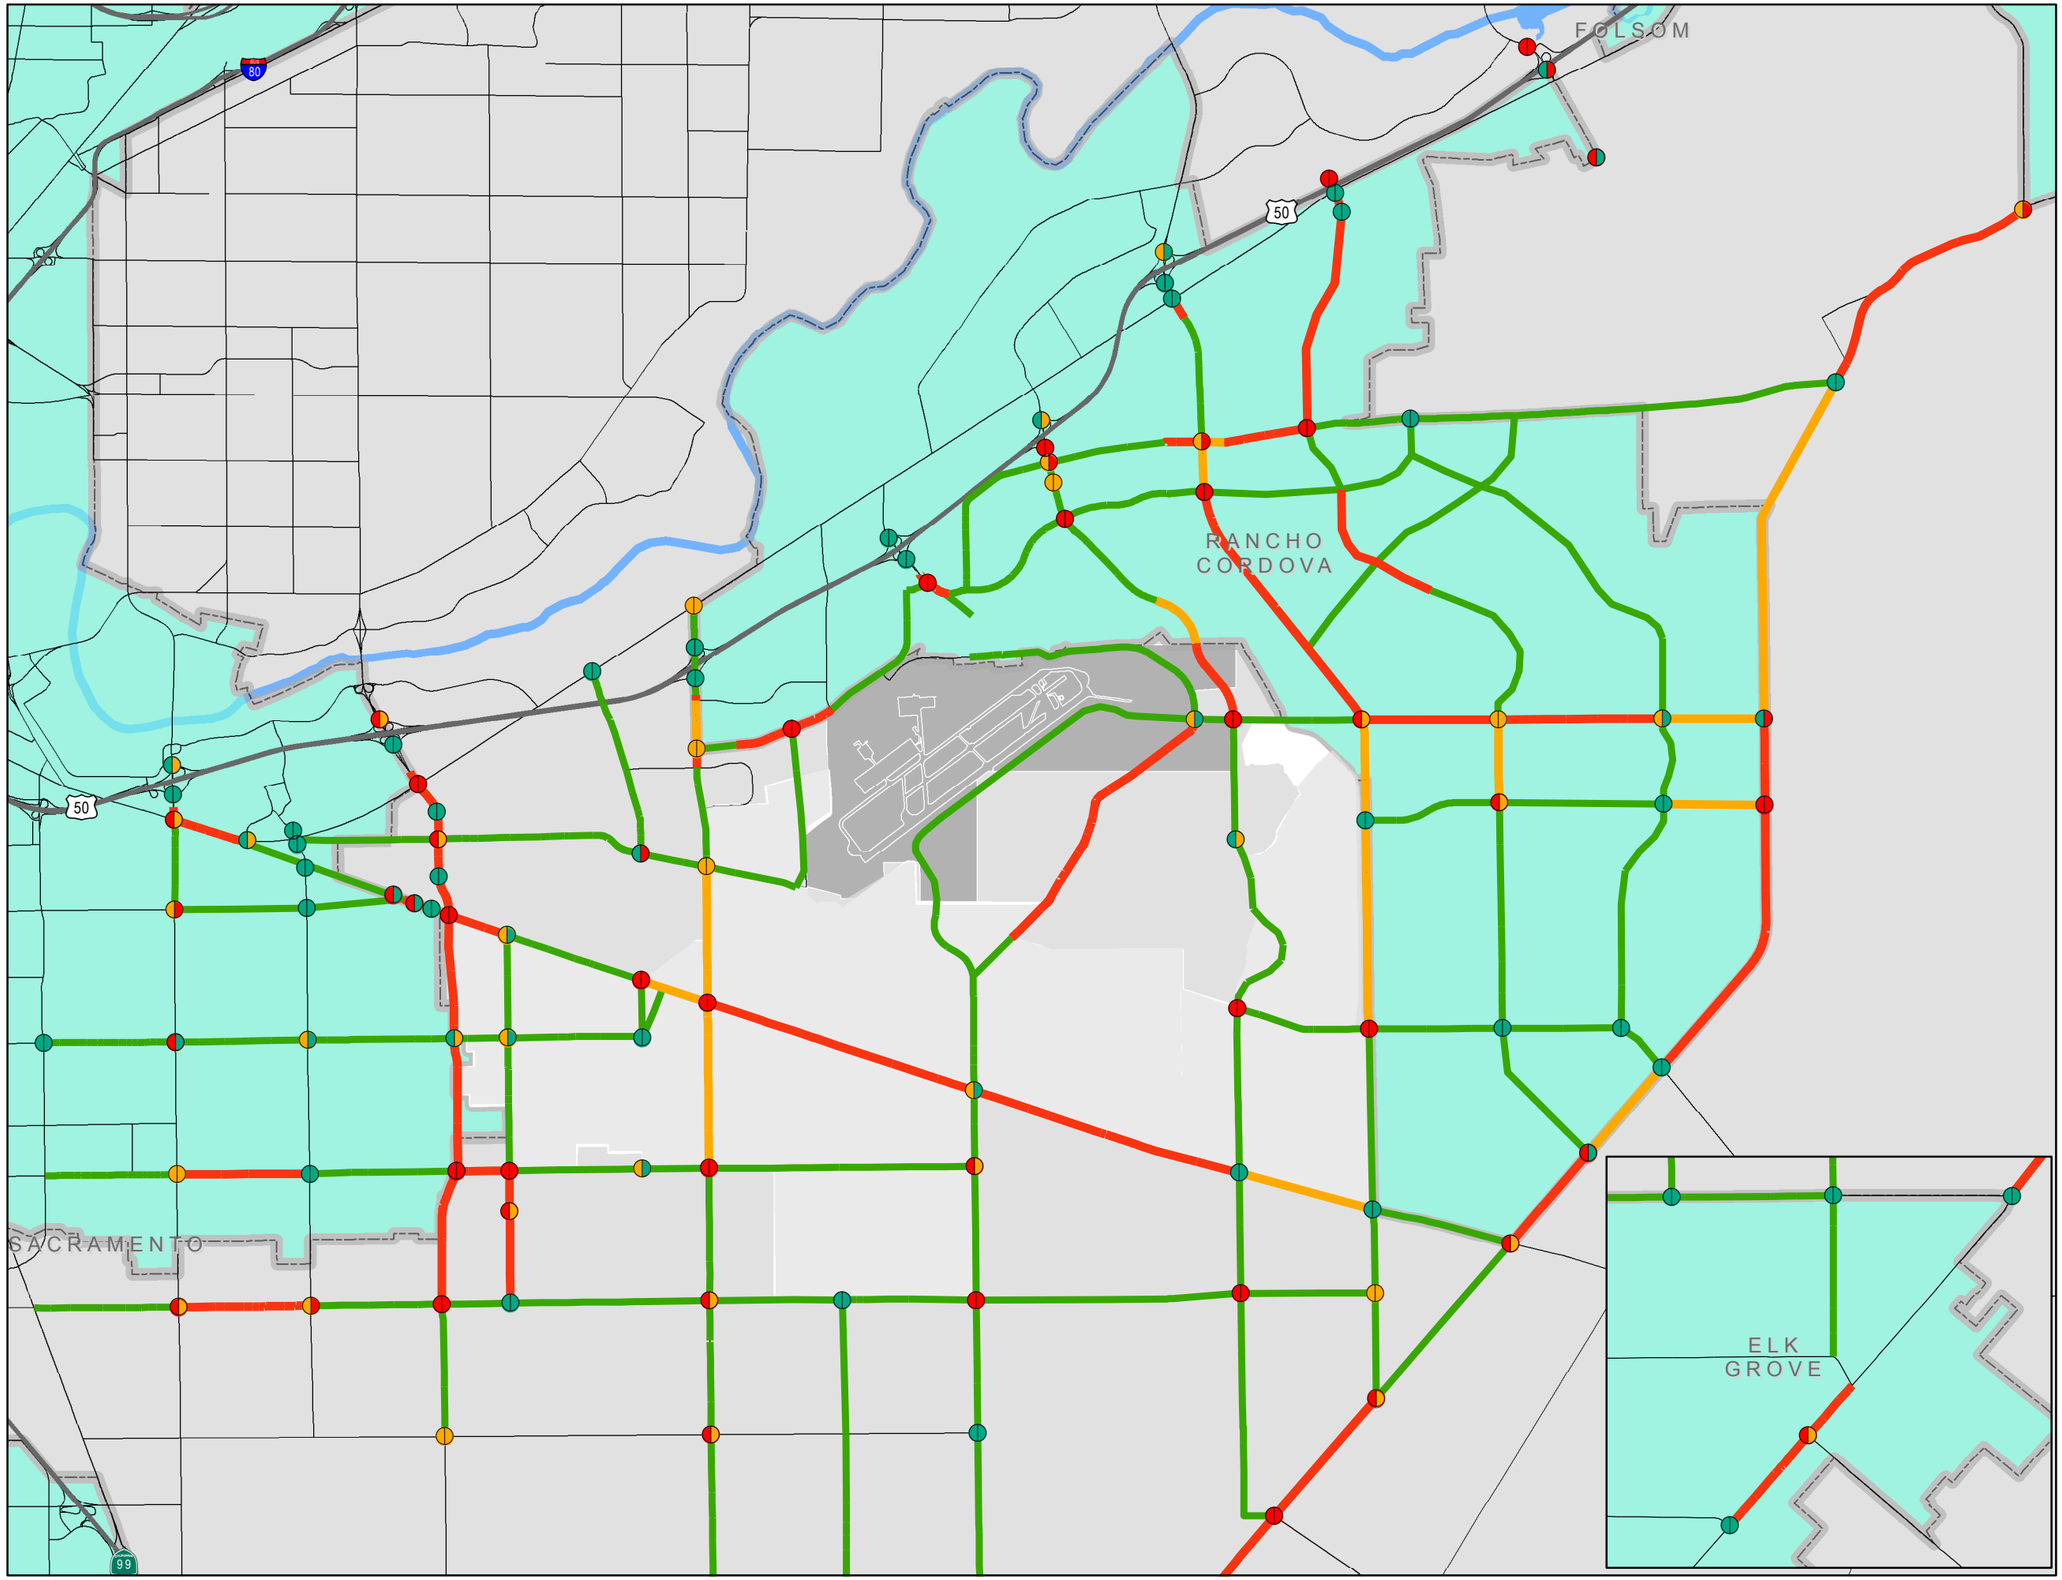
10.4.3.1 Freeway Basic Segments

Table 10.7 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:

- Eastbound
    - Stockton Boulevard to 59th Street - a.m. peak hour

10.4.3.2 Freeway Ramp Junctions / Weaving

Table 10.8 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. The following locations exhibit significant impacts:



- Westbound
    - Hazel Avenue to Rancho Cordova Parkway weave - a.m. peak hour

10.4.3.3 Freeway Ramp Intersection Queuing

Tables 10.9 and 10.10 summarize a.m. and p.m. peak hour freeway ramp intersection queuing. The following locations exhibit a significant impact:

- Eastbound
    - Exit ramp to Howe Avenue - right turn queue length exceeds available storage – a.m. peak hour
    - Exit ramp to Zinfandel Drive-right turn and through queue length exceeds available storage – a.m. peak hour
- Westbound
    - Exit ramp to Rancho Cordova Parkway - left turn queue length exceeds available storage – a.m. and p.m. peak hours

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

10.4.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Impacts

The FOUR PROJECTS would not remove any existing or planned pedestrian facility that is planned in the Bikeway Master Plan. The FOUR PROJECTS would add pedestrian and bicycle demands within the FOUR PROJECTS site and to and from nearby land uses. Specific information on improvements to on- and off-site bicycle and pedestrian facilities is not available at this time. Because the FOUR PROJECTS would add demand for pedestrian and bicycle facilities that may not be available, the impact of the FOUR PROJECTS on pedestrian and bicycle circulation is potentially significant.

10.4.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Impacts

Public transit would not be provided to the sites of the FOUR PROJECTS under CEQA Cumulative scenario without development of the FOUR PROJECTS. In the preparation of this analysis, a transit system to serve the FOUR PROJECTS was developed (see Section 8.1.2.3). However, the timing and implementation of the transit system are uncertain at this time. The FOUR PROJECTS would increase demands for public transit facilities. Therefore, the impact of the FOUR PROJECTS on the transit system is potentially significant.

10.4.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts

Table 10.11 summarizes the results of the rural roadway segment functionality analysis. Figure 10.7 illustrates the resultant functionality impacts. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

10.5 MITIGATION

10.5.1 CEQA Cumulative Plus FOUR PROJECTS Roadway Segment Mitigation

Table 10.12 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

10.5.2 CEQA Cumulative Plus FOUR PROJECTS Intersection Mitigation

Tables 10.13a and 10.14a summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. **Tables 10.13b and 10.14b** summarize the results of the operations analysis for the study area intersections with the ultimate mitigation, which may exceed the County's standard number of approach lanes. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 10.14a and Table 10.14b also identify those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These

alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Three intersections are currently designated as "High Capacity Intersections" on the County's General Plan: Watt Avenue & Folsom Boulevard, Watt Avenue & Kiefer Boulevard, and Watt Avenue & Jackson Road. At two intersections on Bradshaw Road where an LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures by designating those two intersections as High Capacity Intersections: Bradshaw Road & Mayhew Road and Bradshaw Road & Jackson Road.

A high capacity intersection would utilize special treatments to increase the capacity of the intersection so as to reduce congestion and travel delay. Since each intersection could have unique travel movements, volumes and existing context sensitive conditions, the special treatments utilized at each high capacity intersection will be selected to meet the specific needs of each intersection. The range of special treatments is quite wide, ranging from the restriction of certain turning movements to various combinations that could include grade separating certain movements. While the field of traffic engineering is ever expending and evolving resulting in the use of new technologies and treatments, special treatments such as the following could be utilized at a high capacity intersection:

- Restricting turning movements
- Median U-turns
- Roundabouts
- Split intersections
- Quadrant roadway intersections
- Bowtie intersections
- Directional flyovers
- Center turn overpass
- Grade separated Roundabout
- Diverging diamond grade separation
- Compact diamond grade separation
- Single point urban grade separation
- Traditional urban grade separation

The County has conducted conceptual engineering to define potential improvements at the three study area intersections on Watt Avenue that are currently designated as "High Capacity Intersections" on the County's General Plan. These are:

- At the **Watt Avenue & Folsom Boulevard** intersection, the County proposes an ultimate configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off-ramps from the left lanes of Watt Avenue to a single signalized intersection. A bus rapid transit (BRT) lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal. This design is consistent with the

recommendations of the South Watt Area Transportation Study (SWATS) dated November 1, 2002 and approved by the Board of Supervisors on November 26, 2002, and with the planning study for the *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Kiefer Boulevard** intersection, the County proposes a tight diamond interchange as the ultimate improvement. The through movements (and BRT lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard. This design is proposed in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr & Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

- At the **Watt Avenue & Jackson Road** intersection, the County proposes a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications. 1) The southbound left-turn movement would be grade separated; 2) The westbound right-turn movement would be grade separated; and 3) Three northbound left-turn lanes are proposed. This configuration represents an enhanced version of Alternative 6 in the planning study prepared for *State Route 16 (Jackson Road) Corridor Study* (Fehr and Peers, 2012). It should be noted that the State Route 16 study has only had a staff-level review done by Caltrans, Sacramento County Department of Transportation, City of Rancho Cordova, and City of Sacramento. Other equivalent mitigation measures may be selected to the satisfaction of the Department of Transportation to mitigate the project's impact.

At the new proposed "High Capacity Intersection" at Bradshaw Road and Jackson Road, the ultimate configuration has not been defined. A number of improvement options involving one or more of the special treatments identified above could be defined that would mitigate the LOS impact at this location.

Additionally, grade separated intersections are proposed along Grant Line Road, in order to meet the Connector JPA's level of service policy. These grade separations would be constructed at Prairie City Road (which is also a designated High Capacity Intersection), White Rock Road, Douglas Road, Kiefer Boulevard, Jackson Road, and Sunrise Boulevard.

Since each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints, etc.), the special treatments utilized at each location will need to be studied to select the treatments that mitigate the LOS impact, while avoiding or minimizing other impacts.

10.5.3 CEQA Cumulative Plus FOUR PROJECTS U.S. 50 Freeway Mitigation

According to Caltrans' US-50 Transportation Concept Report (TCR) and Corridor System Management Plan (CSMP), all mainline freeway lanes of the 8-lane ultimate facility (4 lanes in each direction) have already been built, with the exception of the segment between Zinfandel Drive and Sunrise Boulevard (where 6 of the 8 ultimate lanes exist today). With the exception of this segment, capacity improvements to widen the freeway mainline are precluded by the ultimate configuration in the TCR/CSMP. The TCR/CSMP does conceptualize other projects that will benefit the US-50 corridor without adding additional mainline travel lanes. These improvements generally fall into one of three categories:

- Intelligent transportation systems (ITS) and integrated corridor management (ICM) projects. Some examples may include ramp metering and multimodal improvements.
- Improvements to parallel local facilities. Such projects are expected to reduce travel demand on US-50.
- Future HOV lanes and auxiliary lanes. These projects would extend, or bridge gaps in, the existing HOV and auxiliary lane network. Constructing these lanes is permissible even when further widening of the mainline is not allowable, and is consistent with the ultimate configuration in the TCR/CSMP.

The FOUR PROJECTS shall participate in one or more of these alternative improvements that could directly reduce the severity of the project's impact and/or provide operational benefits to the US-50 corridor in general.

10.5.3.1 US-50 Eastbound Alternative Improvements

To lessen the impact to the eastbound US-50 mainline between Stockton Boulevard and 59th Street, the project may pay a fair share toward the construction of:

- Ramp meter improvements (Caltrans ITS/OPS Project List)

10.5.3.2 US-50 Westbound Alternative Improvements

To lessen the impact to the westbound US-50 weave between Hazel Avenue and Rancho Cordova Parkway, the project may pay a fair share toward the construction of:

- Multi-modal corridor improvements and interchange improvements at Hazel Avenue (2035 SACOG MTP)
- Auxiliary lanes between Hazel Avenue and Rancho Cordova Parkway (2035 SACOG MTP)

Note: Gray shading represents changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, as proposed by the County of Sacramento.

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan or standard intersection geometry, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

[1] High capacity intersections are defined in the Sacramento County General Plan and may include grade separations, additional turn lanes, and/or other features as deemed appropriate by the County.

[2] Alternative mitigations represent proposed mitigations beyond the General Plan or standard intersection geometry, excluding high capacity intersections, as proposed by the County of Sacramento.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

10.5.4 CEQA Cumulative Plus FOUR PROJECTS Pedestrian and Bicycle Facility Mitigation

The FOUR PROJECTS applicants shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the FOUR PROJECTS and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the FOUR PROJECTS vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

10.5.5 CEQA Cumulative Plus FOUR PROJECTS Transit System Mitigation

The applicants of the FOUR PROJECTS shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 8.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the FOUR PROJECTS. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the FOUR PROJECTS, must be phased with development of the FOUR PROJECTS.

10.5.6 CEQA Cumulative Plus FOUR PROJECTS Functionality Mitigation

Table 10.15 summarizes the results of the functionality analysis for the study area rural roadway segments with mitigation.

10.5.7 CEQA Cumulative Plus FOUR PROJECTS Mitigation Summary

Tables 10.16 through 10.21 summarize the roadway segments, intersections, and freeway facilities that would exhibit significant LOS impacts, along with the mitigation success for these impacts.

Table 10.15

71	Jackson Rd	Excelsior Rd	Eagles Nest Rd	4	Arterial M	62,440	Yes[3]	Widen to County standards [5]	No

Red text with light gray shading indicate project impacts.

Table 10.15
CEQA Cumulative Plus FOUR PROJECTS (Proposed Project) Functionality Mitigations

ID	Roadway	Segment		CEQA Cumulative + FOUR PROJECTS				Mitigation	Impact after Mitigation?
		From	To	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]		
77	Kiefer Blvd	Bradshaw Rd	Happy Ln	6	Arterial M	51,510	Yes[3]	Widen to County standards [5]	No
78	Kiefer Blvd	Zinfandel Dr	Sunrise Blvd	3	Arterial M	39,640	Yes[3]	Widen to County standards [5]	No
89	Mayhew Rd	Jackson Rd	Fruitridge Rd	4	Arterial M	53,200	Yes[3]	Widen to County standards [5]	No
116	White Rock Rd	Fitzgerald Rd	Grant Line Rd	4	Arterial M	55,990	Yes[3]	Widen to County standards [5]	No
123	Zinfandel Dr	Douglas Rd	Kiefer Blvd	4	Arterial M	22,240	Yes[3]	Widen to County standards [5]	No

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

11. CEQA CUMULATIVE PLUS JACKSON TOWNSHIP (PROPOSED PROJECT) SCENARIO

11.1 JACKSON TOWNSHIP PROJECT DESCRIPTION AND METHODOLOGY

11.1.1 Project Description

As illustrated previously in Figure 1.1, the Jackson Township project is located in unincorporated Sacramento County, generally east of the City of Sacramento and south of the City of Rancho Cordova and Mather Airport. It is bounded on the south by Jackson Road (SR 16) and on the west by Excelsior Road. The north boundary is near the future Kiefer Boulevard, while the east boundary is west of Eagles Nest Road.

11.1.2 Methodology

The analysis of the CEQA Cumulative Plus Jackson Township Project scenario is based upon the analysis of the CEQA Cumulative Plus FOUR PROJECTS scenario discussed in Section 6. The travel model was utilized to estimate the portion of the FOUR PROJECTS traffic that is associated with the Jackson Township project. With this information, it was possible to identify whether the Jackson Township project, on its own, would trigger significant impacts. It should be noted that, even at locations where the Jackson Township project on its own would not trigger a significant impact, the Jackson Township project contributes to the cumulative impacts associated with the CEQA Cumulative Plus FOUR PROJECTS scenario.

11.1.1 CEQA Cumulative Land Use

Section 10.1.1 discusses land use associated with CEQA Cumulative conditions.

11.1.2 Transportation Network

Section 10.1.2 discusses the transportation network associated with the CEQA Cumulative conditions, including the transportation network improvements associated with the FOUR PROJECTS.

11.1.3 Jackson Township Project Trip Generation

The trip generation of the Jackson Township project was estimated by the SACSIM model, which has been utilized to prepare transportation forecasts for this analysis. **Table 11.1** summarizes the person trip generation. The Jackson Township project would generate over 24,000 daily work person trip ends, and over 192,000 daily person trip ends for all trip purposes.

The total trip generation of the Jackson Township project is somewhat higher under the CEQA Cumulative scenario than with existing conditions. The SACSIM model will vary the trips generated by retail and service uses depending on the amount of development that is near those uses. This result is expected as commercial development with much housing and/or employment

nearby will be more successful (and generate more trips) than the same commercial development located in an area with less nearby population.

Table 11.1: Estimated Daily Person Trip Generation (CEQA Cumulative Plus FOUR PROJECTS Proposed Project Scenario)

Jackson Township Specific Plan

Project	Trip Purpose	Daily Person Trip Ends
Jackson Township	Work Trips	24,001
	Non-Work Trips	168,919
	All Trip Purposes	192,920

Source: *DKS Associates, 2018.*

Table 11.2 summarizes the estimated mode choice for the Jackson Township Project. Over 84 percent of all person trips are expected to be accommodated by automobile. Transit will serve about 2.4 percent of all trips, while walk and bike modes will accommodate about 12.9 percent of all trips.

Table 11.3 summarizes the vehicular (auto) trip generation of the Jackson Township project. The Jackson Township project is estimated to generate over 118,000 daily vehicle trip ends. About 24,400 of the daily vehicle trip ends will be associated with trips with both an origin and destination within the Jackson Township project, about 20 percent of the trip ends. Those internal trip ends represent about 12,200 daily vehicle trips (one-half the number of internal trip ends). The Jackson Township project will generate about 94,000 external vehicle trips that have an origin or destination inside the Jackson Township project but the other end of the trip is outside the Jackson Township project. Table 11.3 also shows the vehicle trips generated during the a.m. and p.m. peak hours.

11.1.4 Jackson Township Project Trip Distribution

The distribution of trips associated with development on the Jackson Township project site was derived utilizing SACSIM, incorporating the proposed land use and access locations associated with the Jackson Township project site. Trip distribution varies by land use and time period. **Figure 11.1** illustrates the overall trip distribution of daily Jackson Township project trips with the CEQA Cumulative scenario.

11.2 OPERATIONS ANALYSIS AND IMPACTS

11.2.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Impacts

Table 11.4 summarizes the results of the operations analysis for the study area roadway segments. Only those segments where an impact would be triggered by the Jackson Township project are shown. The table includes the number of lanes assumed with the implementation of

the FOUR PROJECTS. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate new roadways or widened roadways. The last column of the table shows the project(s) responsible for the increase in the number of roadway lanes. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact.

11.2.2 CEQA Cumulative Plus Jackson Township Project Intersection Impacts

Table 11.5 and 11.6 summarize the results of the operations analysis for the study area intersections. Only those intersections where an impact would be triggered by the Jackson Township project are shown. The tables include the implementation of intersection changes associated with the FOUR PROJECTS. Table 11.6 illustrates the type of traffic control and number of lanes by type on each study area intersection approach. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type would be fully funded by the project(s) shown in the last column. Shaded table cells in Table 11.5 illustrate those locations with an LOS impact. Detailed analysis information is included in the technical appendix.

Signal warrant analysis was conducted for all unsignalized intersections along Jackson Road, and other unsignalized intersections in close proximity to the project. The project is considered to have a significant impact at an unsignalized location if both the impact criteria in Table 1.6 are met, and one or more of the signal warrants specified in the California Manual on Uniform Traffic Control Devices (CAMUTCD) are met. The following unsignalized intersections exhibit significant impacts and meet one or more traffic signal warrants:

- Eagles Nest Road and Florin Road

Table 11.2: Mode Split (CEQA Cumulative Plus FOUR PROJECTS Prop. Proj. Scenario)

Jackson Township Specific Plan

Project	Mode	Percentage of Person Trips by Trip Purpose		
		Work Trips	Non-Work Trips	All Trip Purposes
Jackson Township	Auto - SOV	81.0%	40.1%	45.2%
	Auto - HOV	9.4%	43.8%	39.5%
	Transit	5.8%	1.9%	2.4%
	Walk	2.6%	12.9%	11.7%
	Bike	1.1%	1.3%	1.2%

Source: *DKS Associates, 2018.*

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

Note: Gray shading represents changes in traffic control or approach lanes for which the project is responsible to pay a fair share.

11.2.3 CEQA Cumulative Plus Jackson Township Project U.S. 50 Freeway Impacts

Based upon the Caltrans' thresholds of significance, any volume contribution to a significant impact of the CEQA Cumulative Plus FOUR PROJECTS scenario is considered significant. Therefore, the impacts of the CEQA Cumulative Plus Jackson Township Project scenario are identical to those of the CEQA Cumulative Plus FOUR PROJECTS scenario.

11.2.3.1 Freeway Basic Segments

Table 10.7 summarizes a.m. and p.m. peak hour US 50 freeway mainline operations. Details of the analysis are included in the technical appendix. None of the impacts would be triggered by the Jackson Township project alone.

11.2.3.2 Freeway Merge/Diverge/Weave Segments

Table 10.8 summarizes a.m. and p.m. peak hour freeway operations at ramp junctions and weaving areas. Details of the analysis are included in the technical appendix. None of the impacts would be triggered by the Jackson Township project alone.

11.2.3.3 Freeway Ramp Intersection Queuing

Tables 10.9 and 10.10 summarizes a.m. and p.m. peak hour freeway ramp intersection queuing. None of the impacts would be triggered by the Jackson Township project alone.

11.2.4 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Impacts

The Jackson Township project would not remove any existing or planned pedestrian facility. The Jackson Township project would not remove any existing bicycle facility, but would modify facilities that are planned in the Bikeway Master Plan. The Jackson Township project would add pedestrian and bicycle demands within the Jackson Township project site and to and from nearby land uses. As illustrated in Figure 3.2, the Jackson Township project has proposed changes to the Bikeway Master Plan. Because the Jackson Township project would add demand for pedestrian and bicycle facilities that may not be available in the site vicinity, the impact of the Jackson Township project on pedestrian and bicycle circulation is potentially significant.

11.2.5 CEQA Cumulative Plus Jackson Township Project Transit System Impacts

Public transit would not be provided to the site of the Jackson Township project under CEQA Cumulative scenario without development of the Jackson Township project. In the preparation of this analysis, a transit system to serve the FOUR PROJECTS was developed (see Section 8.1.2.3).

However, the timing and implementation of the transit system are uncertain at this time. The Jackson Township project would increase demands for public transit facilities. Therefore, the impact of the Jackson Township project on the transit system is potentially significant.

11.2.6 CEQA Cumulative Plus Jackson Township Project Functionality Impacts

Table 11.7 summarizes the results of the functionality analysis. Only those segments where an impact would be triggered by the Jackson Township project are shown. The table includes the number of lanes assumed with the implementation of the FOUR PROJECTS, which in many cases is greater than the number of lanes in the existing condition. The shaded table cells under the "Travel Lanes" heading illustrates new roadways and widened roadways that are assumed part of the FOUR PROJECTS. The "Substandard?" heading indicates whether or not a roadway meets the County standards of 12-foot lanes and 6-foot shoulders. If the FOUR PROJECTS make improvements to a roadway segment such as widening, they would be required to reconstruct the entire substandard roadway segment to County standards. The shaded table cells under the "Functionality Impact?" heading indicate those locations with a functionality impact.

As stated above, the traffic analysis assumed that the FOUR PROJECTS would construct a number of travel lanes on roadway segments that are internal to or on the boundary of the FOUR PROJECTS, and the entire roadway segment would be reconstructed to County standards at that time. The timing of implementation of such additional traffic lanes on these internal or boundary roadway segments will affect whether or not impacts would exist at some time prior to full build out of the FOUR PROJECTS.

Table 11.7
CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts Triggered by Jackson Township Project

ID	Roadway	Segment		Jurisdiction	Existing Substandard Roadways				CEQA Cumulative + FOUR PROJECTS			
		From	To		Travel Lanes	Pavement (ft)	Substandard? [1]	Existing Volume	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]

Red text with light gray shading indicate project impacts.

Table 11.7
CEQA Cumulative Plus FOUR PROJECTS Functionality Impacts Triggered by Jackson Township Project

ID	Roadway	Segment		Jurisdiction	Existing Substandard Roadways				CEQA Cumulative + FOUR PROJECTS			
		From	To		Travel Lanes	Pavement (ft)	Substandard? [1]	Existing Volume	Travel Lanes	Facility Type[1]	Forecasted Volume	Functionality Impact? [2]

Note: Gray shading indicates changes in travel lanes or facility type that the project is responsible to provide. For all roadway segments to be widened, the project is responsible to build the entire roadway to County standards.

[1] Substandard rural roads are defined as rural, 2-lane roadway segments with travel lanes narrower than 12 feet and/or roadside shoulders narrower than 6 feet.

[2] Functionality impacts are triggered when a substandard rural road increases over a threshold of 6,000 ADT, or for a roadway already above 6,000 ADT, increases by more than 600 ADT.

[3] The potential for an impact exists should the project generate traffic volumes on the roadway exceeding 6,000 ADT, or increasing more than 600 ADT on a roadway already above 6,000 ADT, prior to the construction of roadway improvements.

[4] Excluding the roadway segment that is within the developed community of Independence at Mather.

[5] The functionality impact is mitigated by improving the roadway to County standards, including widening travel lanes to 12 feet and/or widening or providing paved shoulders to 6 feet.

Red text with light gray shading indicate project impacts.

11.3 MITIGATION

11.3.1 CEQA Cumulative Plus Jackson Township Project Roadway Segment Mitigation

Table 11.8 summarizes the results of the operations analysis for the study area roadway segments with mitigation. Where feasible, the number of roadway lanes was increased to mitigate the impact. However, the increased number of lanes could not exceed the maximum General Plan designations of the appropriate jurisdictions. The shaded table cells under the "Travel Lanes" and "Facility Type" headings illustrate widened roadways for mitigation purposes, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations that would continue to have LOS impacts after mitigation. The table also includes the constraint that precluded full mitigation of the LOS impact.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the improvements allowed under the General Plan would not mitigate an LOS impact, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

Note: Gray shading represents changes in travel lanes or facility type that the project is responsible to provide.

[1] The following classifications are used to determine daily roadway capacity:
Arterial L - Arterial, Low Access Control
Arterial M - Arterial, Moderate Access Control
Arterial H - Arterial, High Access Control
Rural Hwy - Rural 2-lane Highway
Rural S - Rural 2-lane Road, 24'-36' of pavement, Paved Shoulders
Rural NS - Rural 2-lane Road, 24'-36' of pavement, No Shoulders
Res Collector F - Residential Collector with Frontage
Res Collector NF - Residential Collector with No Frontage

[2] Alternative mitigations represent proposed mitigations beyond the General Plan, as proposed by the County of Sacramento.

Bold values do not meet LOS policy. **Red** values with light gray shading indicate project impacts.

11.3.2 CEQA Cumulative Plus Jackson Township Project Intersection Mitigation

Tables 11.9a and 11.10a summarize the results of the operations analysis for the study area intersections with mitigation. However, the increased number of lanes on each approach does not exceed the County's standard number of approach lanes. **Tables 11.9b and 11.10b** summarize the results of the operations analysis for the study area intersections with the ultimate mitigation, which may exceed the County's standard number of approach lanes. Shaded table cells indicate those locations where changes in traffic control and / or number of approach lanes by type have been made to mitigate impacts, which would be the responsibility of the FOUR PROJECTS to fund. The Jackson Township project would contribute a fair share. The shaded table cells under the "Level of Service" heading indicate those locations with an LOS impact after mitigation. Table 11.10a and Table 11.10b also identifies those intersections that would continue to have LOS impacts after mitigation, along with the constraint that precluded full mitigation. Detailed analysis information is included in the technical appendix.

The "LOS Impact with Mitigation?" column shows whether there is still an LOS impact after the mitigation measure is applied. In other words, this column shows whether a mitigation measure successfully mitigates the impact or not. In several locations where the LOS impact could not be mitigated by implementing the County's standard number of approach lanes, the County has proposed alternative mitigation measures, which are shown in the "Alternative Mitigation" column. These generally include providing additional turn lanes, carrying an additional through lane past the intersection, or designating the intersection as a High Capacity Intersection. These alternative mitigation measures will either fully mitigate the impact or substantially reduce the level of impact.

High Capacity Intersections

Grade separated intersections are proposed along Grant Line Road, in order to meet the Connector JPA's level of service policy. These grade separations would be constructed at Prairie City Road (which is also a designated High Capacity Intersection) and Sunrise Boulevard. Since each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints, etc.), the special treatments utilized at each location will need to be studied to select the treatments that mitigate the LOS impact, while avoiding or minimizing other impacts.

11.3.3 CEQA Cumulative Plus Jackson Township Project Pedestrian and Bicycle Facility Mitigation

The Jackson Township project applicant shall coordinate with Sacramento County to identify the necessary on- and off-site pedestrian and bicycle facilities to serve the proposed development. These facilities shall be incorporated into the Jackson Township project and could include sidewalks, stop signs, standard pedestrian and school crossing warning signs, lane striping to provide a bicycle lane, bicycle parking, signs to identify pedestrian and bicycle paths, raised crosswalks, pedestrian signal heads, and all appropriate traffic calming measures as defined in the County's Neighborhood Traffic Management Program (NTMP). Sidewalks would be required as part of the frontage improvements along all new roadway construction in the Jackson

Township project vicinity in conformance with County design standards. Circulation and access to all proposed public spaces shall include sidewalks that meet Americans with Disabilities Act standards.

11.3.4 CEQA Cumulative Plus Jackson Township Project Transit System Mitigation

The applicant of the Jackson Township project shall coordinate with Regional Transit (or other transit operators) to provide the additional transit facilities and services assumed in transportation analysis (see Section 8.1.2.3), or a cost-effective equivalent level of transit facilities and services.

The assumed transit routes and service frequency would be required at full development of the Jackson Township project. The full level of transit service would not achieve adequate transit ridership during the early stages of development. Thus the ultimate transit service, like the roadway system serving the Jackson Township project, must be phased with development of the Jackson Township project.

11.3.5 CEQA Cumulative Plus Jackson Township Project Functionality Mitigation

Table 11.11 summarizes the results of the functionality analysis for the rural roadway segments with mitigation.

12. VEHICLE MILES TRAVELED PER CAPITA

12.1 VMT DESCRIPTION

For CEQA purposes, California Senate Bill 743 (SB 743) dictates a change in the evaluation of transportation impacts, primarily shifting from level of service (LOS) to vehicle miles traveled (VMT). The VMT metric combines mode choice and trip length into a single parameter that is generally proportional to greenhouse gas (GHG) effects. The CEQA changes proposed under SB 743, however, are currently voluntary and will not become mandatory until at least January 1, 2020. This section discusses VMT analysis that was prepared for the proposed projects under Existing Plus Project and MTP Cumulative Plus Four Projects conditions.

12.2 METHODOLOGY

The analysis presented in this section was prepared using a methodology generally consistent with the methodology adopted by SACOG to determine regional thresholds and VMT Per Capita regionally. Because SACOG's adopted model (SacSIM) is a "tour-based" Activity Based Model (ABM) it is possible to trace every daily trip undertaken by each member of each household, whether or not each trip originates or terminates at the person's home or somewhere else. Therefore, it is also possible to trace the total distance traveled by each person during the day and the mode used for each trip. This allows SACOG (and this analysis) to calculate detailed VMT per capita for all trips undertaken by residents of the region or a particular study or project area. This VMT, combined with VMT of trips for non-residential uses within the study or project area, results in overall VMT (and VMT per capita) generated by the study or project area.

12.3 EXISTING PLUS PROJECT

Table 12.1 shows the estimated VMT per capita under Existing Plus Jackson Township conditions. Over 14,500 people are anticipated to generate over 297,500 vehicle miles traveled per day. That equates to an average 20.4 vehicle miles traveled per capita per day, higher than the predicted 18.6 VMT per capita average in the total region.

12.3 MTP PLUS ALL PROJECTS

Table 12.1 also depicts the estimated VMT per capita in the Jackson Corridor under MTP Cumulative Plus Four Projects condition. Each of the four projects are anticipated to have a higher VMT per capita than the remainder of the region. In total, the population in the region (3,139,601) is predicted to generate 54,154,989 daily vehicle miles; translating to 17.3 vehicle miles traveled per capita per day.

Table 12.1
Estimated VMT per Capita Jackson Corridor Joint TIS

Scenario	Population	VMT	VMT/Capita
Existing plus Jackson Township			
Jackson Township	14,597	297,769	20.4
Remainder of Regional	2,214,577	Varies	18.5
Total Region	Varies	Varies	18.6
MTP Plus All Projects			
Jackson Township	14,597	264,306	18.1
Mather South	8,703	159,094	18.3
New Bridge	9,183	187,527	20.4
West Jackson	35,561	674,632	19.0
Remainder of Regional	3,071,557	52,869,430	17.2
Total Region	3,139,601	54,154,989	17.3

Notes

User approved volume balancing among the lanes for turning movement.

* HCM 2010 computational engine requires equal clearance times for the phases crossing the barrier.

Pedestrian Green has to be less than Phase Max Green.
